In connection with this matter we have also received a letter addressed to non-members to ascertain, if such an extension of the aims of the Association were adopted, whether they would allow themselves to be proposed as members of the new Association. A draft of rules accompanies the Report, from which we extract the following proposed rules:—"That the Association be called 'The Association for the Improvement of Mathematical Teaching'; that its object shall be to effect improvements in the teaching of the various branches of elementary mathematics and mathematical physics by such means as may appear most suitable in each particular case. This object to be carried out by the reading of papers or raising discussions at meetings of the Association, by the appointment of committees to report on existing defects in the usual methods, order, range, &c., in teaching special subjects, and the expediency of drawing up syllabuses or text-books of such subjects; by the employment of suitable means for bringing the work done by the Association before the universities and other educational or examining bodies, and using its influence to obtain recognition of such work from those bodies."

Another action on the part of the meeting was the passing a resolution "that a sub-committee be appointed to draw up proofs of the propositions of the syllabus of plane geometry." It was shown that many teachers had adopted the syllabus, and that it was meeting with a growing acceptance was evidenced by the steadily improving annual sale, 2033 copies having been already sold.

ILLUSTRATIONS OF NEW OR RARE ANIMALS IN THE ZOOLOGICAL SOCIETY'S LIVING COLLECTION[1]

II.

NORTH-EASTERN ASIA has of late years disclosed to its explorers a number of very curious novelties in the class of Mammals. Amongst them are several species of great interest, examples of which have reached the Gardens of the Zoological Society alive.

4. The Tcheli Monkey (*Macacus Tcheliensis*) was so named by the distinguished zoologist, M. Alphonse Milne-Edwards of Paris, from the Chinese province of Tcheli (or Petcheli), in which it is found. The existence of a monkey in a latitude so far north—on nearly the same isothermal line as the city of Paris—is a very remarkable fact, and quite new to zoological distribution.

The occurrence of this monkey in the mountains of the north-eastern district of the province of Petcheli seems to have been first ascertained by M. Fontanier, who was for some years French Consul at Pekin, and who transmitted

[1] Continued from p. 38.

many valuable specimens to the Museum of the Jardin des Plantes at Paris. Amongst these was an example of the present animal—a female, not quite adult—which was described and figured by M. Alphonse Milne-Edwards in his "Études pour servir a l'Histoire Naturelle des Mammifères" (Paris, 1868-1874). The celebrated naturalist, Père David, also seems to have met with this monkey in the same district, as he includes it in several lists of the Mammals of Northern China which he has recently published.

For their pair of this scarce monkey now living in the Regent's Park, the Zoological Society are indebted to the kind exertions of one of their Corresponding Members, Dr. S. W. Bushell of H.B.M. Legation at Pekin. Dr. Bushell obtained these animals in 1880 from the Yung-ling, or Eastern Mausoleum, of the reigning Manchu dynasty, situated about 70 le from Pekin to the north of 40° N.L.

The Tcheli monkey belongs to the same section of the group as the well-known Rhesus monkey (*Macacus rhesus*), but has a shorter ta
rufous colour. It is also

the truth of the axiom, that in Nature at least there is no law without an exception. Here we have a deer complete in everything except its antlers, usually the *most* characteristic feature in the males of these animals. In place of antlers the buck Water-deer is provided with other organs of defence in the shape of two long exserted canine teeth, which grow to a considerable size in the adult, and give him ample means of exercising his pugnacious powers.

For our first knowledge of the existence of this singular deer we are indebted to the exertions of the late Robert Swinhoe, who, during his residence in various parts of the Chinese Empire, added so largely to our knowledge of every part of its fauna. Mr. Swinhoe obtained his first specimens of the *Hydropotes* in the market of Shanghai in the winter of 1879, and described it at one of the meetings of the Zoological Society in the following year.

characteristic of these antler-

less deer is their extraordinary fecundity. Mr. Swinhoe states that according to the testimony of the natives the mothers have four or five young at a birth, and that this is corroborated by Europeans who have killed gravid females and found the like number of embryos in the uterus. This account is to some extent confirmed by observations on the Water-deer in captivity in Europe. Although the Zoological Society have not succeeded in inducing this animal to breed in the Regent's Park, this feat has been accomplished by M. Josephe Cornély of the

a height of about twenty inches, and is generally of a pale fawn-colour, paler below.

According to Mr. Swinhoe the "Chinese at Shanghai call this animal the *Ke*; but at Chinkiang it is named *Chang*—the classical term for the Muntjac (*Cervulus Reevesi*). The Chinese dictionary, compiled under authority of the Emperor *Kanghe*, describes the *Ke* as 'stag-like, with feet resembling those of a dog, has a long tusk on each side of the mouth, and is fond of fighting.'"

uninviting aspect: and their quaint inhabitants view with ill-concealed dislike the presence of foreign ships within their waters.

I was enabled to land on two occasions on the Island of Mackau—the largest of a group of islands bearing that name. About six miles in length, it possesses some half-dozen lofty peaks, which range in height from 800 or 900 feet to 1400 feet above the sea. Naked masses of quartzite or quartz-rock crown the summits and often compose the upper third of the hills, whilst a thick and dense growth of creepers, shrubs, and mimosas clothes the hill-slopes for their lower two-thirds. The quartzite passes insensibly into a compact quartzitic sandstone underlying it; and lower down this rock assumes a coarse-grained texture, occasionally containing pebbles of quartz embedded in it. From the nature of the ground it was difficult to find

forest to these islands in October.

trustworthy signs of bedding in these rocks. Cropping out in the lower third of the hills—from the cliffs and the slopes immediately above them—are beds of a highly micaceous rock—greisen—and a gneissose rock sometimes approaching in its characters the typical gneiss; these beds are inclined at an angle of 15° to the east-north-east. Veins of quartz are observed to traverse both these rocks, whilst occasionally a layer of quartz—an inch in thickness—separates contiguous beds.

I had no opportunity of landing on any other islands of the archipelago, many of which in their general appearance resemble that of the Island of Mackau.

H. B. GUPPY

NOTES

THE International Medical Congress which it is proposed to hold in London in the beginning of August will be the seventh of its kind. The previous meetings have been held biennially in the principal university towns of the Continent. At the last meeting in Amsterdam in 1879, a general wish was expressed that the next should be in England, and the wish having been informally communicated to the Presidents of the College of Physicians and the College of Surgeons, they called a meeting of presidents or other delegates of all the Univerities, Medical Corporations, Public Medical Services, and the Medical Societies. The proposal to hold the Congress in London was heartily agreed to, and an Executive Committee was appointed under who-e direction, and, especially, by the energy of the General Secretary, Mr. MacCormack, a very large scheme has been arranged for the discussion of the most interesting questions in all the divisions of the Medical Sciences. The Meetings will be held in fifteen sections, in rooms of most of which the use has been granted by the University of London, the Royal Academy, and all the learned Societies at Burlington House. Others have been engaged at Willis's Rooms. The officers and councils of the several sections include, with very few exceptions, all the chief and most active teachers and workers in the several subjects of medical science and practice, not in London alone, but in all the universities and great towns in the United Kingdom. In so far as general consent to the design of the Congress may be regarded as a promise of success, all looks well, and the agreement of our own countrymen is well matched by the assurances of co-operation already received from a large number of the most distinguished medical investigators and practitioners in both the Old World and the New. About 4000 invitations were issued, and it is expected that the roll of members will include at least 2000 names. Of course there are large arrangements for receptions and various hospitalities, and for making London as agreeable and instructive as may be in August; but if the design in the programme of the Congress be fairly fulfilled, a great quantity of hard and useful scientific work will be well done.

AT a meeting of the American Academy of Arts and Sciences held in Boston, Massachusetts, on January 12, the Rumford medal was conferred on Prof. Josiah Millard Gibbs, of Yale College, for his researches on Thermodynamics.

WE regret to hear of the death of Prof. James Tennant, F.G.S., the well-known mineralogist. Mr. Tennant was the assistant and afterwards the successor of Mr. Mawe, author of "Travels in Brazil," and of a "Treatise on Diamonds," and by adding to the series obtained by Mr. Mawe many fine specimens from every part of the globe, succeeded in thus forming a very large and valuable collection of minerals. Mr. Tennant was an excellent authority on gems, and his advice was taken by the Government with respect to the cutting of the Koh-i-Noor and other crown jewels. Besides holding the office of "Mineralogist to the Queen," Mr. Tennant was for many years Professor of Geology and Mineralogy in Kin

Another anecdote states that when the census commissioner entered a certain compound with the forces of enumeration in his train, an ayah who had been taken account of by enumerator and supervisor both, ran excitedly to her mistress and warned her that there would be certainly some mistake in the hisab, for that the sirkar had counted her twice already and was going to count her again!

In a note on the Russian and Siberian varieties of the *Gammarus pulex* (*Memoires* of the St. Petersburg Society of Naturalists, vol. xi. fasc. 1) M. Semenovsky shows that the representatives of this species in Lake Baikal and in Lake Goktcha of High Armenia, 6400 feet above the sea-level, are quite identical, and most akin to the Norwegian typical representative of this species, described by Prof. Sars. On the contrary, the *G. pulex*, which inhabits the lakes of the Taimyr *tundras* of Northern Siberia, that of the Baraba Steppe in Western Siberia and of the Ural region, belongs to another variety. A second variety, very different from the two preceding, was discovered in two salt lakes of the Government of Orenburg, notwithstanding the close proximity of one of these lakes to those of the Ural region. A third variety inhabits the northern lakes of European Russia and those of the Valdai Hills, whilst a fourth variety, being most like to that which is known from the lakes of Savoy, was discovered in the lakes near St. Petersburg.

It is known that the young horns of the *Cervus maral* (Severtzoff), when they are filled with blood and not yet ossified, are very much prized by the Chinese, who purchase them at the Siberian frontier, paying as much as six to twenty pounds the pair. A very active chase of the maral has therefore always been carried on in Siberia, and since it became rather rare, the Cossacks in the neighbourhood of Kiakhta have domesticated this stag. Now we learn from a communication by M. Polakoff that its domestication has greatly extended in Western Siberia, so that there are herds of seventy head; but the horns of the domesticated deer, as might be expected, have lost a good many of their original qualities.

In a recently-discovered stalactite cave at Kirchberg, near Kremsmünster (Austria), a jaw-bone of a man with well-preserved teeth was found among numerous remains of *Ursus spelæus*.

It is reported from Stuttgart (Wirtemberg) that bones of mammoth and rhinoceros have been brought to light by digging in a cellar on loamy ground. Dr. Fraas has recognised, besides ribs (60 cm. and 200 cm. long), two pieces of a jaw-bone belonging to a mammoth, and parts of mandibles, scapula, and maxilla of a rhinoceros.

The Mineralogical Museum at Breslau University has received a large number of bones belonging to the woolly-haired Rhinoceros (*Rhinoceros tichorhinus*). They were found near Skarsine in Silesia. The complete skeleton was found in a marl-pit at a depth of sixteen feet. Unfortunately the skull and several bones were broken through inattention on the part of the workmen. This is the fifth skeleton of the kind found in Silesia.

On February 20 a slight shock of earthquake occurred at Agram at 2h. 15m. a.m., and a more severe one at 6h. 15m. a.m., accompanied by a subterranean noise. During the last week wave-like motions were also felt.

The *Daily News* Lisbon correspondent, telegraphing on February 23, states that thirty-six successive shocks of earthquake have been experienced at St. Michael's in the Azores. "The church and 200 houses fell in. Several people were killed. A religious and penitential procession had taken place, the Civil Governor at the head. A volcanic island has been formed. At latest advices slight shocks continued. Many people were in tents outside the town."

THE Khedive of Egypt has nominated M. Gaston Maspero to the directorship of the museums in the place of the late archæologist, M. Mariette. To the latter a monument is to be erected at Cairo. A committee has already been formed, of which the Foreign Minister is president.

A NEW Italian serial will shortly be published at Naples. Its title will be *Rassegna critica di opere scientifiche e letterarie*, and its editor Prof. Andrea Angiulli. It will appear six times a year.

LAST Thursday the Hackney Microscopical and Natural History Society held their annual *soirée*, always a very successful event. Many other similar London societies were represented at the meeting.

AN elaborate report upon the opening up of two of the pyramids at the boundary of the Libyan Desert near Sakkara is now published by Prof. Brugsch. The learned professor estimates the matter to be of the most important and valuable kind. At the close of 1880 the entrances to the sepulchral chambers of the three pyramids were laid bare. The ceilings were taken off, and only the two sides, all covered with hieroglyphics, rose from the *débris*. The hieroglyphics point to the reign of Pharaoh Apappus.

THE additions to the Zoological Society's Gardens during the past week include a Bactrian Camel (*Camelus bactrianus*) from Afghanistan, presented by Col. O. B. C. St. John, R.E., F.Z.S.; a Punjaub Wild Sheep (*Ovis cycloceros*) from Afghanistan, presented by Capt. W. Cotton; a Mona Monkey (*Cercopithecus mona*) from West Africa, presented by Mr. W. Macmillan Scott; two Common Peafowls (*Pavo cristatus*) from India, presented by Mrs. Edward Brown; a Roseate Cockatoo (*Cacatua rosicapilla*) from Australia, presented by Miss Mary J. Richardson; a Stump-tailed Lizard (*Trachydosaurus rugosus*) from Australia, presented by Mr. F. O. Maitland; a Horsfield's Tortoise (*Testudo horsfieldi*) from Cabul, deposited; two Globose Curassows (*Crax globicera*) from Central America, a White-browed Amazon (*Chrysotis albifrons*) from Honduras, purchased.

GEOGRAPHICAL NOTES

WE take the following from the March number of the *Proc.* of the Royal Geographical Society:—The eminent Russian traveller and *savant*, Col. Prejevalsky, intends, we are informed, to devote himself for some time to the preparation in retirement of a great work on the results of his travels, including, besides his recent expedition to Tibet, his previous journey to Lob-nor, of which he was prevented, by want of time, from giving more than a bare outline. The work is to consist of eight volumes, and to be entitled "Travels in the Deserts of Central Asia." Volumes i. and ii. will contain the narrative and an account of the physical geography and ethnography of the countries he has visited, and will include also his surveys, the pictorial illustrations being from original sketches by his companion, Lieut. Robarofsky. Vol. iii. will be devoted to the mammalia of Central Asia; vol. iv. to the birds; vol. v. to the reptiles, amphibia, and fishes; vol. vi. to the flora of Mongolia; and vol. vii. to that of Tibet. Vol. viii. and last will contain the geology and mineralogy as far as materials will permit. The first two volumes, each containing 500 pages, and perhaps more, will be written by the traveller himself, and will appear towards the close of 1882. The ornithology will also proceed from his pen, as well as that portion of the zoology which treats of the antelope, buffalo, and a few other of the more important animals. The remainder will be written by the Academicians Strauch and Maximovitch, Professors Kepler, Inostrantsef, and Bogdanof, and will be issued in parts. The whole will not be completed for several years. The work will be brought out under the auspices of the Geographical Society, and a special grant for the purpose will be asked for from H.M. the Emperor.

AT the Geographical Society on Monday evening Sir Richard Temple delivered a lecture on the lake-region of Sikkim on the frontier of Tibet, which, in point of fact, was a description of the impressions acquired during a tour which he made as Lieu... Governor of Bengal. Sir R. Temple told his audience that t... fact of any part of Sikkim being British territory was due to t... imprisonment of Sir Joseph Hooker and Dr. Campbell by t... Rajah; and he then gave a geographical sketch of the whol... region. Possibly the most important matter dealt with was t... construction of the politico-commercial road from Darjiling ... the Jyalap Pass into the Chumbi Valley, which Sir R. Temp... considers the frontier-line between British and Chinese territ... Sir R. Temple is apparently sanguine that the Tibetans w... continue the road on to Lhasa, but he did not say when th... were likely to do so. Mr. W. T. Blanford, who had a... visited Sikkim, afterwards explained to the meeting that ... believed these lakes to be due to glacial action, and that t... Bidan Tso was a beautiful specimen of this kind of lake. M... Blanford also called attention to the opening afforded ... exploration in Northern Sikkim, which has not as yet be... visited by Europeans.

WE understand that Mr. Joseph Thomson has been elec... a life-member of the Royal Geographical Society, in furth... recognition of his eminent services to geography during ... recent East African expedition. The Council of the Soci... have presented to the British Museum the collection of sk... which he made during his journey.

THE *Oesterreichische Monatschrift für den Orient* of t... month contains a highly interesting paper by Prof. H. Vambé... on the proposed Hyrkanian railway, a valuable description ... the roads and land communications of Persia by Baron Göl... Lannoy in Tcheran, a paper on the coffee districts of Yem... by Baron Schweiger-Lerchenfeld, besides two well-writt... historical papers.

AT the last meeting of the Berlin Geographical Society Pr... W. Förster, the director of the Berlin Observatory, made ... interesting communication regarding one of the most import... tasks of travellers in unknown regions, &c., the exact determi... tion of latitude, longitude, and elevation above sea-level. W... several of the results of recent German expeditions scie... errors in this regard were detected. Prof. Förster stated t... the Berlin Observatory staff would shortly be in a position ... undertake the practical and theoretical instruction of travell... and to superintend the selection, testing, and packing of t... necessary scientific instruments for the various expeditions bef... starting.

THE last number of the *Tour du Monde* contains an inte... ment of Dr. Crevaux's account of his journey from Cayenne ... the Andes, the present part dealing more particularly with t... exploration of the River Parou. The illustrations are fro... original sketches, and are admirably drawn.

IN a recent issue *Les Missions Catholiques* publishes a lett... from a missionary among the Kakhyens, which contains so... interesting notes concerning that comparatively unknown peopl...

A SYDNEY telegram states that a bushman named Skulthor... has telegraphed from Blackall asserting that he has found t... explorer Leichhardt's grave, and has recovered the diary of t... whole of his last expedition, together with other relics. Sku... thorpe refuses to show any of the articles until his arrival i... Sydney.

THE last number of *Le Globe* contains part of a paper entitle... "Tartarie," by M. F. de Morsier, in which the writer propose... to deal with the Tartar, Turcoman, and Kirghiz steppes.

BY a telegram from Brisbane we learn that the Queensland... Government expedition for the survey of the projected Trans... continental railway started on January 14, presumably from ... Blackall. A previous survey, it will be remembered, was ... made by a party under Mr. Favenc, despatched by the proprietor... of the *Queenslander*, but so far as we are aware no detailed ... account of his explorations has ever been made public, and ... possibly the new expedition has been sent to endeavour to find ... a better line of route.

THE Wellington correspondent of the *Colonies and India* ... states that the Southern Alps and other of the principal mount... tains of New Zealand are to be explored next year by members ... of the Alpine Club, who will find ample scope for their energies. ... The top of Mount Cook, the loftiest peak in New Zealand, ... between 13,000 and 14,000 feet in height, has not yet been ... reached.

THE International Alpine Congress will meet at Salzburg in ... 1882. The committee is now being formed.

ON THE VISCOSITY OF GASES AT HIGH EXHAUSTIONS[1]

BY the viscosity or internal friction of a gas is meant the resistance it offers to the gliding of one portion over another. In a paper read before the British Association in 1859 Maxwell[2] presented the remarkable result that on theoretical grounds the coefficient of friction, or the viscosity, should be independent of the density of the gas, although at the same time he stated that the only experiments he had met with on the subject did not seem to confirm his views.

An elaborate series of experiments were undertaken by Maxwell to test so remarkable a consequence of a mathematical theory; and in 1866, in the Bakerian lecture for that year,[3] he published the results under the title of "The Viscosity or Internal Friction of Air and other Gases." He found the coefficient of friction in air to be practically constant for pressures between 30 inches and 0·5 inch; in fact numbers calculated on the hypothesis that the viscosity was independent of the density agreed very well with the observed values.

The apparatus used by Maxwell was not of a character to admit of experiments with much lower pressures than 0·5 inch.

Maxwell's theory that the viscosity of a gas is independent of the density presupposes that the mean length of path of the molecules between their collisions is very small compared with the dimensions of the apparatus; but inasmuch as the mean length of path increases directly with the expansion, whilst the distance between the molecules only increases with the cube root of the expansion, it is not difficult with the Sprengel pump to produce an exhaustion in which the mean free path is measured by inches, and even feet,[4] and at exhaustions of this degree it is probable that Maxwell's law would not hold.

The experiments recorded in this paper were commenced early in 1876, and have been continued to the present time. In November, 1876, the author gave a note to the Royal Society on some preliminary results. Several different forms of apparatus have since been used one after the other, with improvements and complexities suggested by experience or rendered possible by the extra skill acquired in manipulation. The earlier observations are now of little value, but the time spent in their prosecution was not thrown away, as out of those experiments has grown the very complicated apparatus now finally adopted.

The Viscosity Torsion Apparatus, with which all the experiments here given have been performed, is a very complicated instrument. It consists essentially of a glass bulb, blown with a point at the lower end, and sealed on to a long narrow glass tube. In the bulb is suspended a plate of mica, by means of a fine fibre of glass 26 inches long, which is sealed to the top of the glass tube, and hangs vertically along its axis. The plate of mica is ignited and lamp-blacked over one-half. The tube is pointed at the upper end, the upper and lower points are 46 inches apart, and are accurately in the prolongation of the axis of the tube. Sockets are firmly fixed to a solid support, so that when the tube and bulb are clamped between them they are only able to move around the vertical axis. The glass fibre being only connected with the tube at the top, rotating the tube on its axis communicates torsion to the fibre, and sets the mica plate swinging on the same axis without giving it any pendulous movement. The diameter of the fibre is about 0·001 inch. The viscosity apparatus is connected to the pump by a flexible glass spiral, so as to allow the apparatus to rotate on the pivots and at the same time to be connected to the pump altogether with sealed glass joints. An arm working between metal stops limits the rotation to the small angle only which is necessary.

The torsional movement given to the mica plate by the light of the candle shining on it or by the rotation of the bulb and tube on its axis by the movement of the arm between the stops, is measured by a beam of light from a lamp, reflected from a mirror to a graduated scale.

The pump employed has already been described. The measuring apparatus is similar to that described by Prof. McLeod[1] before the Physical Society, June 13, 1874. As it contains several improvements shown by experience to be necessary when working at very high vacua, a detailed description is given in the paper.

When taking an observation the arm is moved over to the stop, and in a few seconds allowed to return to its original position by the action of a spring. This movement rotates the viscosity apparatus through a small angle, and sets the mica plate vibrating, the reflected line of light traversing from one side of the scale to the other in arcs of diminishing amplitude till it finally settles down once more at *zero*.

The observer watching the moving index of light records the scale number reached at the extremity of each arc. The numbers being alternately on one and the other side of zero are added two by two together, to get the value of each oscillation. The logarithms of these values are then found, and their differences taken; the mean of these differences is the logarithmic decrement per swing of the arc of oscillation. For the state of brevity this is called the log dec.

A very large number of experiments have been made on the viscosity of air and other gases. Observations have been taken at as high an exhaustion as 0·02 M, but at these high points they are not sufficiently concordant to be trustworthy. The pump will exhaust to this point without difficulty if a few precautions are taken, but at this low pressure the means of measuring fail in accuracy.

The precautions which experience shows to be necessary when exhausting to the highest points are fully described in the paper.

Viscosity of Air.—The mean of a very large number of closely concordant results gives as the log decrement for air for the special apparatus employed, at a pressure of 760 millims. of mercury and a temperature of 15° C., the number 0·1124. According to Maxwell the viscosity should remain constant until the rarefaction becomes so great that we are no longer at liberty to consider the mean free path of the molecules as practically insignificant in comparison with the dimensions of the vessels.

The author's observations show that this theoretical result of Maxwell's is at least approximately and may be accurately true in air up to comparatively high exhaustions; and that at higher exhaustions the viscosity falls off, as it might be expected to do according to theory.

The results are embodied in a table and diagrams.

The first half of the table gives the viscosity of air, in so far as it is represented by the log dec., at pressures intermediate between 760 millims. and 0·76 millim. (1000 millionths of an atmosphere). In order to avoid the inconvenience of frequent reference to small fractions of a millimetre, the millionth of an atmosphere[2] (= M) is now taken as the unit instead of the millimetre. The second half of the table is therefore given in millionths, going up to an exhaustion of 0·02 millionth of an atmosphere.[3]

Starting from the log dec. 0·1124 at 760 millims., the viscosity diminishes very regularly, but at a somewhat decreasing rate. Between 50 millims. and 3 millims. the direction is almost vertical, and a great change in the uniformity of the viscosity curve commences at a pressure of about 3 millims. At this point the previous approximation to, or coincidence with, Maxwell's law begins to fail, and further pumping considerably reduces the log decrement.

From 1000 M the diminution of viscosity is very slight until the exhaustion reaches about 250 M; after that it gets less with increasing rapidity, and falls away quickly after 35 M is reached.

The curves of increasing mean free path and diminishing viscosity closely agree. This agreement is more than a mere coincidence, and is likely to throw much light on the cause of viscosity of gases.

[1] Abstract of a paper read before the Royal Society, February 17, 1881, by William Crookes, F.R.S.

[2] *Phil. Mag.*, 4th ser. vol xix. p. 31.

[3] *Phil. Trans.* 1866, part 1, p. 249.

[4] Thus, supposing the mean free path of the molecules of air at the ordinary pressure is the 1-10,000th of a millimetre, at an exhaustion of the ten-thousandth of an atmosphere, the mean free path will be 1 millim. At one-millionth of an atmosphere the mean free path will be 10 centimetres, and at an exhaustion of one hundred millionth—by no means a difficult point to attain with present appliances—the mean free path will be over 30 feet. This rarefaction corresponds to that of the atmosphere at a height above the earth of a little more than ninety miles, assuming that its density decreases in geometrical progression as its height increases in arithmetical progression, and neglecting the small corrections for diminished gravity and temperature. As the height above the earth increases, the length of the mean free path of the molecules of air rapidly approaches to planetary distances; at about 200 miles height the mean free path is 10 million miles, whilst between eighty and ninety miles higher the rarity is such that the mean free path would extend from here to Sirius.

[1] *Philosophical Magazine*, vol. xlvii. p. 110, August, 1874.

[2] M = 0·00076 millim.; 1315·789 M = 1 millim.

[3] To give some idea of the high exhaustions at which its measurements can be taken it may be mentioned that the highest exhaustion on the table—0·02 M—bears about the same proportion to the ordinary atmospheric pressure that 1 millimetre does to thirty miles, or, converting it into time, that one second bears to twenty months.

In the table is also given the measurements of the repulsion exerted on the blackened end of the mica plate by a candle-flame placed 500 millims. off. The repulsion due to radiation commences just at about the same degree of exhaustion where the viscosity begins to decline rapidly, and it principally comes in at the exhaustions above 1000 M.

The close agreement between the loss of viscosity and the increased action of radiation is very striking up to the 35 millionth, when the repulsion curve turns round and falls away as rapidly as the viscosity.

Experiments are next described on the resistance of air to the passage of an induction spark.

Since the publication of the author's researches on the phenomena presented by the passage of the induction discharge through high vacua, the present results—which, although never published, precede by a year or two those just mentioned—have lost much of their interest.

The phenomena at the very high exhaustion of 0·02 M may be of interest. With a coil giving a spark 85 millims. long, no discharge whatever passes. On increasing the battery power till the striking distance in air was 100 millims. the spark occasionally passed through as an intermittent flash, bringing out faint green phosphorescence on the glass round the end of the — pole.

On one occasion the author obtained a much higher exhaustion than 0·02 M. It could not be measured, but from the repulsion by radiation and the low log dec. it was probably about 0·01 M. The terminals of the vacuum tube and wires leading to them were well insulated, and the full power of a coil giving a 20-inch spark was put on to it. At first nothing was to be seen. Then a brilliant green light flashed through the tube, getting more and more frequent. Suddenly a spark passed from a wire to the glass tube, and pierced it, terminating the experiment.

Since these experiments vacua have frequently been got as high, and even higher, but the author has never seen one that would long resist a 20-inch spark from his large coil.

Viscosity of Oxygen.—The series of experiments with air show a complete history of its behaviour between very wide limits of pressure. It became interesting to see how the two components of air, oxygen and nitrogen, would behave under similar circumstances. Experiments were therefore instituted exactly as in the case of dry air, but with the apparatus filled with pure oxygen.

The results are given in the form of tables and plotted as curves on diagrams.

The figures show a great similarity to the air curve. Like it the log dec. sinks somewhat rapidly between pressures from 760 millims. to about 75 millims. It then remains almost steady, not varying much till a pressure of 16 millims. is reached. Here however it turns in the opposite direction, and increases up to 1·5 millim. It then diminishes again, and at higher exhaustions it rapidly sinks. This increase of viscosity at pressures of a few millimetres has been observed in other gases, but only to so small an extent as to be scarcely beyond the limits of experimental error. In the case of oxygen however the increase is too great to be entirely attributable to this cause.

Oxygen has more viscosity than any gas yet examined. The viscosity of air at 760 millims, being 0·1124, the proportion between that of air and oxygen, according to these results, is 1·1185.

This proportion of 1·1185 holds good (allowing for experimental errors) up to a pressure of about 20 millims. Between that point and 1 millim. variations occur, which have not been traced to any assignable cause; they seem large to be put down to "experimental errors." The discrepancies disappear again at an exhaustion of about 1 millim., and from that point to the highest hitherto reached the proportion of 1·1185 is fairly well maintained.

Viscosity of Nitrogen.—The proportion between the viscosities of nitrogen and air at a pressure of 760 millims is, according to these experiments, 0·9715.

A comparison of the air curves with those given by oxygen and nitrogen gives some interesting results. The composition of the atmosphere is, by bulk,

Oxygen	20·8
Nitrogen	79·2
	100·0

The viscosity of the two gases is almost exactly in the same proportion: thus at 760 millims—

$$\frac{20{\cdot}8 \textit{ vis. } O + 79{\cdot}2 \textit{ vis. } N}{100}$$

$$\frac{20{\cdot}8\,(0{\cdot}1257) + 79{\cdot}2\,(0{\cdot}1092)}{100}$$

$$\frac{2{\cdot}61456 + 8{\cdot}64072}{100}$$

a result closely coinciding with 0·1124, th
for air. Up to an exhaustion of about 30

The proportion between the viscosity of
and air at 760 millims. is 0·9208.

Viscosity of Carbonic Oxide.—The results with this gas are remarkable as showing an almost complete identity with those of nitrogen both in position and shape. The viscosity at 760 millims. is in each case 0·1092.

Like that of nitrogen the curve of carbonic oxide is seen to be vertical—*i.e.*, assuming the curve to represent the viscosity, the gas obeys Maxwell's law, at pressures between 90 millims. and 3 millims. The straight portion in nitrogen is at a little higher pressure—between 100 millims. and 6 millims.

The curve of repulsion resulting from radiation is lower in carbonic oxide than in any other gas examined, and, unlike the other gases, there is no sudden rise to a maximum at about 40 M. At lower exhaustions the curve is, however, higher than it is in nitrogen.

During exhaustion observations were continued on the variations in the spectrum. The ordinary band spectrum is first seen with a few sharp lines terminating the bands.

At 12 millims. pressure a sharp green line is first seen, λ 515 ms of mm. This line rapidly grows brighter as exhaustion continues, and then fades out; it is last seen at a pressure of about 0·9 millim. This line is probably the bright oxygen-line, the wave-length of which is given by Plücker at 514·4.

At a pressure of 2·8 millims. the spectrum agrees in appearance with the "Carbon No. 2" in Watts's "Index of Spectra."

At 553 M the bands between the sharp lines appear to be breaking up into masses of fine lines.

At 211 M these fine lines are distinctly visible. The brightness of this spectrum is now near its maximum.

At 100 M the general spectrum is growing faint, but a sharp green line at λ 534 makes its appearance by fits and starts. This is coincident with Plücker's bright oxygen line λ 534.

After this degree of exhaustion the spectrum rapidly gets fainter. The line λ 534 soon disappears, and the carbon lines also go one after the other, until at an exhaustion of 4 M only two lines are visible, λ 560 and λ 519.

Viscosity of Hydrogen.—It has been found that hydrogen has much less viscosity than any other gas; the fact of the log dec. not decreasing by additional attempts at purification is the test of its being free from admixture. This method of ascertaining the purity of the gas, by the uniformity of its viscosity coefficient at 760 millims., is more accurate than collecting samples and analysing them eudiometrically.

Several series of observations in hydrogen have been taken. For a long time it was considered that hydrogen, like other gases, showed the same slight departure from Maxwell's law of viscosity being independent of density that appeared to be indicated with other gases; for the log dec. persistently diminished as the exhaustion increased, even at such moderate pressures as could be measured by the barometer gauge. Had it not been that the rate of decrease was not uniform in the different series of observations, it might have been considered that this variation from Maxwell's law was due to some inherent property of all gases. After working at the subject for more than a year it was discovered that the discrepancy arose from a trace of water obstinately held by the hydrogen. Since discovering this property extra precautions (already described at the commencement of the paper) have been taken to dry all gases before entering the apparatus.

The remarkable character of hydrogen is the uniformity of resistance which it presents. It obeys Maxwell's law almost absolutely up to an exhaustion of about 700 m., and then it commences to break down. Up to this point the line of viscosity is almost perfectly vertical. It then commences to curve over, and when the mean free path assumes proportions comparable with the dimensions of the bulb and approaches infinity, the viscosity curve in like manner draws near the zero line.

The repulsive force of radiation is higher in hydrogen than in any other gas. It commences at as low an exhaustion as 14 millims., but does not increase to any great extent till an exhaustion of 200 M is attained; it then rises rapidly to a maximum at between 40 and 60 M, after which it falls away to zero. The maximum repulsion exerted by radiation in hydrogen is to that in air as 70 to 42·6. This fact is now utilised in the construction of radiometers and similar instruments when great sensitiveness is required.

Taking the viscosity of air at 760 millims. as 0·1124, and hydrogen as 0·0499, the proportion between them is 0·4439.

The Spectrum of Hydrogen.—The red line (λ = 656), the green line (λ = 486), and the blue line (λ = 434) are seen at their brightest at a pressure of about 3 millims., and after that exhaustion they begin to diminish in intensity. As exhaustion proceeds a variation in visibility of the three lines is observed. Thus at 36 millims. the red line is seen brightly, the green faintly, whilst the blue line cannot be detected. At 15 millims. the blue line is seen, and the three keep visible till an exhaustion of 4·18 M is reached, when the blue line becomes difficult to see. At 3·8 M only the red and green lines are visible, the red being very faint. It is seen with increasing difficulty up to an exhaustion of 2 M, when it can be seen no longer. The green line now remains visible up to an exhaustion of 0·37 M, beyond which it has not been seen.

It is worthy of remark that although when working with pure hydrogen the green line is always the last to go, it is not the first to appear when hydrogen is present as an impurity in other gases. Thus, when working with carbonic anhydride insufficiently purified, the red hydrogen line is often seen, but never the green or the blue line.

(*To be continued.*)

SEEING BY ELECTRICITY[1]

ON being called upon by the chairman to show his experiments, Prof. Ayrton stated that he and Mr. Perry thought that the occasion of the reading of Mr. Bidwell's paper was a suitable one for their showing to the Society that they were constructing the apparatus described by them in a letter in NATURE, vol. xxii. p. 31. The feasibility of their plan had been combated, and at the last meeting of the British Association at Swansea it was confidently asserted that the action of selenium was not quick enough to register rapid changes of light intensity—an idea, however, which they stated in the discussion at the time there was experimental evidence to disprove. After that came the publication and exhibition of the photophone, proving that selenium changed its electrical properties synchronously with rapid changes in light intensity. For a light telegraph however not only was this property necessary, but in addition that the electric changes in the selenium should be considerable for a comparatively small change in the light. They had, therefore, tried to make sensitive selenium cells of low resistance. The method they had employed consisted in winding two wires parallel on strips of box-wood, ivory, and other non-conductors in section, somewhat like that of a paper-knife in the manner subsequently described by Mr. Bidwell in NATURE, but they had not found it necessary to cut a screw on the wood or mica in a lathe. Of the twenty-five cells that they had constructed they had invariably found, like Mr. Bidwell, that only those were sensitive that had a high resistance. They were aware that Prof. Adams had made sensitive cells of low resistance, and had he been present they would have liked to ask whether it was not only for very small electromotive forces that the cells were sensitive. They had also found that when sensitive cells of 100,000 ohms resistance diminished in resistance to only a few hundred ohms by natural annealing extending over some months, the cells lost entirely their sensibility. Further that certain sensitive cells of high resistance were sensitive as long as an electromotive force of not more than about seven volts was employed to send a current through them, but for electromotive forces much above this the cells were comparatively unsensitive to light, but the sensibility was not destroyed for electromotive forces smaller than seven volts used subsequently. These phenomena, which they believed had not been previously noticed, pointed, they suggested, to the sensibility of selenium being due almost entirely to a polarisation and not merely to a change of resistance, as was commonly supposed and stated. Might it not be possible, they asked, that there was an electromotive force developed in selenium by light, which, for different cells, increased more rapidly than the resistance of the cell, and which was the greater, the greater the electromotive force of the auxiliary battery employed; that in fact selenium became rapidly polarised by the auxiliary current flowing through it, and that this polarisation, the amount of which depended on this current, was removed in proportion to the intensity of the light. That a small electromotive force was developed in selenium by light when no auxiliary current was sent through it, had been conclusively shown by Prof. Adams and Mr. Day in 1876, a result that they had also experienced; and they would mention that a careful examination which they had recently made of the paper published by Prof. Adams and

[1] Paper communicated to the Physical Society, February 26.

Mr. Day in the *Phil. Transactions* for 1876, showed that if we assumed *all* the instances therein mentioned of sensibility of selenium to light were due to an electromotive force set up, and not to change of resistance at all, then on the whole all the results would have been arrived at if this electromotive force set up in different cells, for the same intensity of light, increased more rapidly than the resistance of the cell, and was the greater, the greater the electromotive force of the auxiliary battery employed. They disagreed therefore from Mr. Bidwell in his idea that the name "cell" was at all inappropriate.

Professors Ayrton and Perry referred the Members to their original letter in NATURE for the account of their plan for seeing by electricity. Shortly, it consisted in projecting at the sending-station an image on a screen consisting of a number of selenium cells, the current flowing in each of which from an auxiliary battery was controlled by the intensity of the light falling on it. At the receiving-end of the line a light was thrown on a screen intercepted more or less by little shutters, the opening or closing of each of which was controlled by the current allowed to pass through the corresponding selenium cell at the sending end. Hence on the receiving screen a picture in mosaics was cast corresponding with the image projected on the screen at the sending-end, and varying with every change in the image cast on the sending-screen.

The experiment they desired to show the Society was the successful reproduction on the receiving-screen of every change of illumination of one square of the sending-screen. The shutter was an elliptical blackened aluminium disk suspended in a blackened tube of a kind of galvanometer, and making an angle of 45° with the tube when all the light tending to pass through the tube was cut off. When this disk was deflected through 45° all the light passed through the tube and an image of a square hole was formed by a small lens attached to the tube. For every intermediate position of the shutter an image of the square hole was formed on the screen, but varying in intensity of illumination. Attached to the shutter was a small magnet making an angle of 67½° with it, and the two were suspended by a silk fibre about one-twentieth of an inch in length. These particular angles were selected so that first all variation in intensity of the illumination could be produced with a small motion of the shutter, and secondly, so that the magnet should always be in its most sensitive position in the coil through which passed the electric current which traversed and was controlled by the corresponding selenium square at the receiving-end of the line. [The apparatus was then shown in action.]

They explained how their method of putting, say, thirty or forty selenium cells on a revolving arm would enable them, while dispensing with a large number of cells, to transmit electrically a complete picture of even moving objects, and would in addition obviate the difficulty arising from abnormal variations of selenium.

Instead of the apparatus exhibited to the meeting to show the perfect feasibility of the scheme, Professors Ayrton and Perry mentioned that they were also experimenting with a large thin mirror with many thick ribs at the back crossing one another. Electro-magnets firmly fixed behind the thin parts of the mirror produced by their expansion and contraction very small convexities and concavities on the mirror's face. From their experiments, published in the *Proc.* Roy. Soc., on the so-called Japanese magic mirrors, it was known that excessively small convexities and concavities of this kind might be made to show themselves in a very decided way on a screen by a divergent beam of reflected light. They proposed to have a circular mirror in rotation, but with only a certain sectional space at the back fitted with electro-magnets as described, and they anticipated that this in conjunction with the rotating section of selenium cells at the other end of the line would produce on a screen a picture over the whole area of the mirror corresponding with the distant image projected on the area traced out by the revolving sector of selenium cells.

EARTH CURRENTS—ELECTRIC TIDES

AT a meeting of the Society of Telegraph Engineers and of Electricians on Thursday evening, February 10, Prof. G. C. Foster in the chair, a communication was read by Mr. Alex. J. S. Adams upon "Earth Currents—Electric Tides," in which the author related that, from investigations he had carried on in connection with earth currents since the year 1866, he considered the globe we inhabit as an electrified sphere whose normal electrical condition was liable to disturbance both from within and from without. Starting upon this theory as a basis, and finding from the result of his observations no evidence that the sun exerted sufficient influence to materially disturb the earth's electricity, he undertook a series of systematic observations upon the daily earth-current variations in strength, to elucidate the question, and obtained consecutive observations every quarter of an hour during the interval from April 1 to 21, 1879, with a result that the curves of those observations coincided throughout with the curve of moon-phases for the same period, and clearly indicated that the chief disturbing power was the moon, and that the earth current variations were strictly *lunar-diurnal*.

"But," said he, "there is a yet deeper meaning to the lunar-diurnal current curve than at first sight appears, for an examination shows that the curve for each day represents *four electric maxima, two of a kind*, and that each maximum is divided from the other by a zero or point of no current." He further explained that whilst two of these maxima always exist upon the opposite sides of the globe, which are in a line *perpendicular* to the moon, two other maxima were also found upon the sides of the globe lying at right angles to the former maxima, and that from a long and careful consideration of these features of the phenomenon he had arrived at the conclusion that whilst the earth's disturbing electricity was, as it were, heaped up by the moon upon the sides of the earth nearest to and farthest from her, much as are the waters of the globe in forming the oceanic tides, the two *lateral* maxima, upon the other hand, must be considered as parts of a belt or band of electrical maximum that encircles the earth in a position at right angles to a line drawn between the earth and moon. Thus it appeared that there were zones of maximum at the sides of the globe nearest to and farthest from the moon, and a *circle* of maximum at right angles between them, the divided from them by zones of no current. This arrangement of the earth's electricity by the moon the author termed the earth's *lunar electric distribution*; the electric maximum facing the moon he designated the *major electric pole*, that farthest from the moon the *minor electric pole*, and the belt of maximum that encircles the earth the *electric circle*. Likewise the zone of no current that divides the electric circle from the major pole he terms the *major zero circle*, and that zero which separates the electric circle from the minor pole, the *minor zero circle*.

The earth's electricity, as thus arranged by the moon, follows that orb in her course through the heavens, and this motion of the earth's disturbed electricity round the earth, yet irrespective of the globe itself, was termed the *lunar diurnal electric circulation*, and the axis upon which it turned the *lunar-diurnal axis*.

A due apprehension however that *the moon's influence is in proportion felt by the earth's electricity at every part of the earth's surface* he considered necessary for the proper appreciation of the reasonings which led to the foregoing deductions.

It was then pointed out that there existed a regular retardation or lagging of the earth-current variations behind the corresponding phases of the moon to the extent of nearly three hours, this curious phenomenon being in no way, so far as he could trace, attributable to solar influence.

The magnetic variations were then considered, and a striking coincidence between the electric and the magnetic lunar-diurnal variation-curves was shown to obtain. The author reasoned that the earth's electric forces as constituted in the *electric distribution* revolved also about an axis parallel to a line passing through the centres of the earth and moon, *i.e.* a line drawn between the major and minor electric poles—a motion of the electric forces that agreed with the *observed direction* of the earth current, and which appeared fully sufficient to account for the effect of lunar-diurnal magnetic variation.

In conclusion he said that a comprehensive consideration of earth-current phenomena opens out a much wider sphere of investigation than that simply embracing variations of strength; it has to recognise *directive influence* which, applied to electricity, means the production of magnetism, and that the electric circulating systems that appear to obtain by reason of these three motions, the *earth's diurnal rotation*, the *lunar current circulation*, and the *terrestrial current circulation*—causes which result in the apparently disconnected variations observable in the movements of the magnetic-needle.

UNIVERSITY AND EDUCATIONAL INTELLIGENCE

CAMBRIDGE.—The examiners for the Natural Science Tripos during this year are Dr. W. H. Gaskell, Prof. Bonney, Mr. T. [illegible], Prof. Watson (Owens College), Prof. Lewis [illegible]

appointed Professor of Mineralogy), Messrs. W. Garnett, F. M. Balfour, and S. H. Vines.

The Rev. W. Cunningham, M.A., of Trinity College, has been appointed Deputy for the Knightbridge Professor, Prof. Birks, and has resigned the Assistant-Secretaryship of the Local Examinations and Lectures Syndicate.

Mr. W. Hillhouse, B.A., of Trinity College, Assistant-Curator of the Botanical Museum, has been approved as a teacher of botany, and Mr. J. J. Lister, B.A., of St. John's College, Demonstrator of Comparative Anatomy, as a teacher of that subject for the purposes of medical certificates.

It was resolved last Thursday to admit women students at Cambridge to the Previous Examination and to the various Tripos Examinations, to publish separate class-lists for women, and in cases where order of merit is indicated in the men's class-lists, to indicate the position which any female student would have taken in the corresponding list of men. The examiners may also state that any candidate who does not attain an honour standard is adjudged to have deserved an ordinary degree. It will be necessary to present a further report on minor details of fees and regulations, but it can hardly be doubted that students duly qualified may be admitted formally to the examinations coming on in June next.

The University accounts just published show that examiners cost the University last year 2200*l.*, professors, demonstrators, lecturers, &c., 8400*l.*, in addition to those specially endowed. The ordinary expenses of the museums and lecture-rooms have been 2500*l.*, while the grant from the University is 2000*l.* The botanic garden has cost nearly 1000*l.*, and 660*l.* has been so far spent on a curator's house. The Local Examinations and Lectures Board have received 8400*l.*, and have invested a further sum of 500*l.*, which at a future time may help to provide a building for this extensive work. The University Library has overdrawn its balance nearly 900*l.*, and the Museums and Lecture Rooms Building Fund is in debt 2725*l.* On the whole it appears that the University has been very careful not to sanction new expenditure in this time of transition, and has succeeded in laying by 3000*l.*, now possessing a capital of 27,000*l.* in stocks. 3000*l.* was the University's income last year from common rents and dividends, while 27,000*l.* was paid by members of the University in fees for examinations, degrees, &c.

In the Special Examinations for the ordinary B.A. degree last year thirty-six candidates entered in Chemistry, nine of whom failed; two in Geology, nine in Botany; only one failed, viz. in Botany. The examiners report that in Chemistry the requirement of practical work has exerted a useful influence. This requirement however entails much additional work on the examiners in Natural Science, and the appointment of a third examiner is recommended.

Next Monday at three o'clock, Dr. W. H. Gaskell will make a communication to the Philosophical Society on the action of the vagus nerve upon the frog's heart; and Mr. F. M. Balfour will discuss the ancestral form of the chordata.

THE Calendar of St. David's College, Lampeter, for 1881, is of interest in connection with the forthcoming report of the Commission on Higher Education in Wales. It contains a full account of the foundation and history of the University, the means at its disposal, and the nature of the education it offers to students. The examination for the B.A. degree of this college includes either physics or chemistry.

SOCIETIES AND ACADEMIES

LONDON

Royal Society, January 27.—"On the Iron Lines widened in Solar Spots." By J. Norman Lockyer, F.R.S.

The observations put forward with reserve in my last communication to the Society have now been confirmed.

In the fine spots visible on December 24, January 1 and 6, many lines in the spectrum of iron were seen contorted, while others were steady.

The facts are given in the following table:—

	The iron lines indicating motion.	Iron lines, visible in the same field of view, steady.

It is to be noted that these observations furnish us with an instance of inversion similar to those frequently obtained in our observations of the most widened lines in spots.

The inferences to be drawn from these observations, and those on which we are now continuously engaged, must be matter for future communication. But I cannot resist calling attention to the crucial nature of the evidence, at least as regards iron, in favour of the view first put forward by Sir B. Brodie, whom we have so recently lost, that the constituents of our terrestrial elements exist in independent forms in the sun.[2]

I have thought it right to send in a record of this work at once, with a view to induce other observers to follow the continually varying phases of the spots during the approaching maximum.

The observations have been made by Mr. H. A. Lawrance, and confirmed by myself in the majority of cases.

Chemical Society, February 17.—Prof. Roscoe, president, in the chair.—The following papers were read:—On the estimation of organic carbon and nitrogen in water analysis simultaneously with the estimation of nitric acid, by M. W. Williams. The author has modified the well-known process of Frankland and Armstrong. Instead of reducing the nitrates with sulphurous acid, he uses the copper-zinc couple of Gladstone and Tribe, which converts nitrates into ammonia. The ammonia produced is distilled off and the distillate nesslerised; the water left in the retort, after distilling off the ammonia, is evaporated to dryness and the residue burnt in the ordinary way. The errors which accompany the use of sulphurous acid are thus avoided, and the time required for the analysis is much shortened.—Capt. Abney and Col. Festing then gave an account of their recent researches on the influence of the molecular grouping in organic bodies on their absorption in the ultra-red region of the spectrum. The authors have photographed the absorption-spectra of numerous inorganic and organic liquids in the region beyond the red. In many cases the presence of an organic radical seems to

[1] In this spot the D lines indicated motion, and *did not retain their parallelism.*

[2] Lecture delivered before the Chemical Society, June 6, 1867.

be characterised throughout its compounds by particular bands. Further research will probably throw much light on the internal structure of chemical substances.—On absorption-bands in the visible spectrum produced by certain colourless liquids, by Dr. Russell and Mr. Lapraik. The authors have carefully drawn the absorption-spectra of various liquids—water, ammonia, &c.—as seen through an ordinary spectroscope.—On the action of hydrochloric acid on ethylene alcohol, by C. Schorlemmer. By heating glycol with an excess of fuming hydrochloric acid in a sealed tube to 100° the author has converted this substance into ethylene dichloride, and has thus disproved the conclusion that the two hydroxyl groups had different functions.—On an attempt to accelerate the process of determining the soluble salts in a soil, by E. W. Prevost. The author added calcium sulphate and barium carbonate to the soil, but in neither case were satisfactory results obtained.

Linnean Society, February 17.—Frank Crisp, LL.B., F.L.S., in the chair.—Mr. Wickham exhibited two collections of Arctic plants. Of fifty-seven species collected by Capt. Markham in Novaya Zemlya (1879) thirty-seven of the most interesting Phanerogams were shown. The absence of species of Gentian is noteworthy, for Arctic Russia, in proximity, possesses six species. Leguminosæ are unrepresented in Spitzbergen and Arctic Greenland, but three species of the order obtain in Novaya Zemlya. Other features of the latter island's flora are equally remarkable. The second collection of typically Polar plants exhibited were those obtained by Mr. Grant in Mr. Leigh Smith's successful voyage to Franz-Josef Land, 1880, and where sixty-one flowering plants were obtained; though the facies of the flora indicates the probability of more yet to be got in this high latitude.—Mr. A. Hammond drew attention to a microscopic specimen and drawing of portion of the wall of the so-called glandular sac of the larva of the Puss moth, from which that insect ejects an acid liquid when alarmed or irritated. Although doubtless the organ is the source of the excretion, it yet is questionable to regard it as a true glandular structure, inasmuch as its tissue is largely composed of chitinous matter.—Dr. Francis Day read a paper, observations on some British fishes. In this he pointed out:—that *Fimelepterus Cornubiensis* is identical with the American *Pamnelas percisformis*, Mitchell; that great confusion exists in the works of Yarrel and Couch respecting the Tunnies and their allies, most, if not all, the examples of the short-finned Tunnies being in reality specimens of *Pelamys sarda*; that the Comber Wrasse (*Labrus Donovani*, Cuv. and Val.), is a peculiarly-coloured variety of *L. maculatus*, Bloch; that *Crenilabrus Bailloni*, Couch, is the *C. melops*, Cuv. and Val. Adult examples of Brill and Sole, coloured on both sides, but in which the eyes were normal, were exhibited. Some Sprats obtained off St. Ives were adverted to, which had fully-developed ova in January this year. It was also proved that the specimen of *Ostracion quadricornis* figured by Couch as a British fish had been brought in salt from abroad by a sailor. Observations also were made by Dr. Day concerning the habits of the Thresher Shark towards the Whale.—Mr. C. B. Clarke gave a communication on right-hand and left-hand contortion of the corolla. In this he maintains that Linnæus's definition of right-hand contortion is correct, and that the criticisms published by M. Alph. de Candolle in "Phytographie" are founded on a misconception. Mr. Clarke holds:—that everybody understands the same direction (viz. the watch-hand direction) by the term right-hand contortion; that the apparent direction of the heavenly bodies is reversed if the spectator looks north instead of south; that the direction of rotation is the same whether the observer supposes himself within or without the helix, but that the apparent direction of a helix is altered if the spectator reverses the direction in which he looks along the axis.—Prof. P. M. Duncan read a paper on some sponges obtained among a mass of fistulose coral from deep water off the coast of Spain during the expedition of the *Porcupine*. One kind, apparently new, is described as a species of *Leodermatium*, *L. affine*, Dunc., and another belongs to the genus *Aphrocalliste*.

Geological Society, February 18.—Annual General Meeting. Robert Etheridge, F.R.S., President, in the chair.—The Secretaries read the Reports of the Council and of the Library and Museum Committee for the year 1880, the Council announcing with much satisfaction that the financial depression under which the Society had been suffering during 1878 and 1879 had proved, as was anticipated, only temporary, and that the Society is now in a very prosperous condition. The Council's Report also announced the publication of the n
Library, which, although considerably lar
expected, will be issued to the Fellows
fixed for it. The Report further announc
various medals and of the proceeds of the
gift of the Society. In presenting the W
to Prof. P. Martin Duncan, M.B., F.R.S
dent addressed him as follows:—Professor
no ordinary pleasure that the Council hav
Wollaston Medal, the highest honour that
bestow, in recognition of the valuable ser
rendered during so many years to the adva
and especially of palæontology; and I may
productive of gratification to me that this
mally conferred upon you by my hands.
palæontologists have been indebted to y
twenty-six memoirs relating to the history,
bution of the fossil Actinozoa, a group w
peculiarly your own by long-continued
searches. Further, you have enriched th
Palæontographical Society with several mo
on the British fossil corals, supplementar
complementary, to the classical monogra
Edwards and Haime. These labours alo
their results, might have justified the Cou
the Wollaston Medal; but besides your
Actinozoa, we have to point to several in
the fossil Echinodermata, to others relating
cal geology (also freely touched upon i
memoirs), and particularly to your exceedi
in connection with the Geological Survey o
the fossil corals of that peninsula, and dis
of both zoological and geological interest
out of the study of those organisms. Pa
sively for nearly twenty years you have foll
research necessary for the fulfilment of you
you have sacrificed the advantages of profe
your energies to the advancement of scienc
it is with much pleasure that I hand to
Medal. The President then presented th
to Prof. Archibald Geikie, F.R.S., F.G
him as follows:—Prof. Geikie,—If a
our Society more than another coul
receive the Murchison Medal for his valu
to geology, it would be yourself; since
contributed more to the advancement of th
the special object of our Society to cultivate
labours in the field connected with your duti
Geological Survey of Scotland, your learned
butions to the *Journal* of our Society, the
Royal Society of Edinburgh and the Glasgow
and other publications too numerous to
qualify you to be the recipient of the medal
chief and friend Sir Roderick Murchison.
contributions to the literature of the geology

Earth Sculpture." The President next hand
to Mr. Warington W. Smyth, F.R.S., for
J. W. Dawson, F.R.S., of Montreal, and
follows:—Mr. Warington Smyth, I need
Council, in awarding the Lyell Medal to Pri
done so with a sincere appreciation of the hi
great labours in the cause of palæontology a
I refer to his published papers I find that
120, and that they give the results of most e
researches in various departments of geology,
upon the palæontology of the Devonian
formations of Northern America. Consid
these numerous contributions, the Council w
justified in awarding to Dr. Dawson one of

ole ground of the value of their contents; but these are far from epresenting the whole of the results of his incessant activity in he pursuit of science. His "Acadian Geology," "Post-pliocene Geology of Canada," and "Fossil Plants of the Devonian and Upper Silurian of Canada," are most valuable contributions to our knowledge of North American geology; whilst in his 'Archaia," "The Dawn of Life," and other more or less popular writings he has appealed, and worthily, to a wider public. We are indebted to his researches for nearly all our knowledge of he fossil flora of the Devonian and other Precarboniferous rocks of America, and of the structure and flora of the Nova-Scotian coal-field; and finally I must refer especially to his original investigation of the history, nature, and affinities of *Eozoon*. These researches are so well known that they have gained for Dr. Dawson a world-wide reputation. The President then handed the Bigsby Medal to Prof. Morris, F.G.S., for transmission to Dr. Charles Barrois, and addressed him as follows:—Professor Morris, Dr. Barrois's chief or most important work written in the year 1876, and published at Lille) is "Recherches sur le terrain crétacé supérieur de l'Angleterre et de l'Irlande," a production almost exhaustive in its description of the cretaceous rocks of England and Ireland, and of the utmost value to English students of geology. Dr. Barrois in this work has been the first to attempt to arrange the English Cretaceous rocks in palæontological zones, and eminently has he succeeded in defining and correlating the horizons of France and Britain. In handing to Prof. J. W. Judd, F.R.S., Sec.G.S., the balance of the Wollaston Donation Fund for transmission to Dr. Ramsay H. Traquair, F.G.S., the President said:—Professor Judd, in handing to you, to be forwarded to Dr. Traquair, the balance of the proceeds of the Wollaston Donation Fund, I have to request that you will inform him of the feeling of the Council, that it is rarely that they can have the opportunity of awarding this fund to a more able and accomplished naturalist than himself. His long-continued researches upon the ganoid fishes of the Carboniferous formation have rendered his name eminent in this department of palæontology. The President next presented the balance of the proceeds of the Murchison Donation Fund to Mr. Frank Rutley, F.G.S.; one moiety of the balance of the proceeds of the Lyell Donation Fund to Mr. G. R. Vine; the second moiety of the Lyell Donation Fund to Prof. H. G. Seeley, F.R.S., F.G.S., for transmission to Dr. Anton Fritsch, of Prague. The ballot for the council and officers was taken, and the following were duly elected for the ensuing year: President, R. Etheridge, F.R.S.; Vice-Presidents: John Evans, F.R.S., J. W. Hulke, F.R.S., Prof. J. Morris, M.A., and H. C. Sorby, F.R.S.; Secretaries: Prof. T. G. Bonney, F.R.S., Prof. J. W. Judd, F.R.S. Foreign Secretary, Warington W. Smyth, F.R.S.; Treasurer, J. Gwyn Jeffreys, F.R.S. Council: H. Bauerman, Rev. J. F. Blake, M.A., Prof. T. G. Bonney, F.R.S., W. Carruthers, F.R.S., Prof. P. M. Duncan, F.R.S., Sir P. de M. Grey-Egerton, Bart., M.P., F.R.S., R. Etheridge, F.R.S., John Evans, F.R.S., Lieut.-Col. H. H. Godwin-Austen, F.R.S., J. Clarke Hawkshaw, M.A., Rev. Edwin Hill, M.A., W. H. Hudlestone, M.A., J. W. Hulke, F.R.S., J. Gwyn Jeffreys, F.R.S., Prof. J. W. Judd, F.R.S., Prof. N. S. Maskelyne, M.P., F.R.S., J. Morris, M.A., J. A. Phillips, F. W. Rudler, Prof. H. G. Seeley, F.R.S., Warington W. Smyth, F.R.S., H. C. Sorby, F.R.S., H. Woodward, F.R.S.

Zoological Society, February 15.—Prof. W. H. Flower, F.R.S., president, in the chair.—The Secretary read a report on the additions that had been made to the Society's Menagerie during the month of January, and called special attention to a White-nosed Saki (*Pithecia albinasa*), purchased January 11; an American Monkey of the genus *Callithrix*—probably referable to *C. brunnea*, purchased along with the preceding; and an example of an Insectivore of the genus *Tupaia* (probably *T. tana*), obtained by purchase on the same day.—Mr. Sclater exhibited and made remarks on some eggs of *Opisthocomus cristatus*, obtained at Obydos on the Amazons.—Mr. Howard Saunders exhibited on behalf of Capt. E. A. Butler, and made remarks on specimens of the eggs of *Dromas ardeola*.—The Rev. O. P. Cambridge, C.M.Z.S., exhibited and made remarks on a Hymenopterous parasite, hatched from larvæ found on two spiders—*Linyphia obscura*, Blackw. ♀ and *L. zebrina*, Menge ♂. The larvæ were stated to be apodous, and to adhere to the abdomen of the spider, which, when full-grown, they fully equalled in size.—Mr. E. W. H. Holdsworth exhibited a specimen of White's Thrush (*Turdus varius*), killed in South Devonshire in January last.—Mr. C. O. Waterhouse read a paper on the Coleopterous Insects belonging to the family *Hispidæ*, collected by Mr. Buckley in Ecuador. Seventeen species of *Hispidæ* had hitherto been recorded as inhabiting that country; of these Mr. Buckley had met with fifteen, which, together with nineteen new species, made a total of thirty-six species in the series now described.—Mr. W. L. Distant read a paper on some additions which had been lately made to the Rhynchotal Fauna of the Ethiopian Region, nine new species belonging to the families *Pentatomidæ*, *Coreidæ*, and *Pyrrhocoridæ* were pointed out, and in the *Coreidæ* two new genera, allied to *Petillia* and *Petascelis*, were described. The specimens had been obtained from Western, Southern, and Eastern Africa.—A communication was read from Mr. Edgar A. Smith on some shells from Lakes Tanganyika and Nyassa and from other localities in East Africa, lately received by the British Museum. Great interest attached to some of the shells from Lake Tanganyika, from the fact that they had all the appearance of being modified marine types.—Lord Walsingham read a paper on some new and little known species of North American Tineidæ, amongst which were three new generic forms.

Meteorological Society, February 16.—Mr. G. J. Symons, F.R.S., president, in the chair.—I. L. Bell, F.R.S., J. Bernays, A. W. Blyth, J. Church, F. W. Cory, S. Cutler, T. L. K. Edge, C. Horsley, W. D. Howard, C. Kelly, M.D., G. Lingwood, W. Macgeorge, Capt. J. P. Maclear, R.N., A. Rigg, and H. C. Stephens were elected Fellows of this Society.—The following papers were read:—Relative humidity, by Charles Greaves, M. Inst. C.E., F.G.S. The object of this paper was to show that the term "relative humidity" was frequently the cause of misunderstanding, and that it was desirable that some other tables with a more correct denomination should be used in order that reliable values of this factor in our climate should be recorded.—On the frost of January, 1881, over the British Isles, by William Marriott, F.M.S. The author pointed out that the severe frost of the 7th to the 26th was remarkable for its unexpected appearance, its long continuance, and its sudden breaking up. The weather during the first week of January was comparatively mild, but frost set in over the north of Scotland on the 5th. The author then gave the lowest thermometrical readings from about 300 stations in the United Kingdom for each day of the frost, which were plotted upon diagrams, clearly showing the relative severity of the weather experienced in each district. The lowest readings were − 15° at Garstang on the 16th, and − 22° at Blackadder, − 16° at Kelso, − 15° at Stobo, − 11° at Thirlestane Castle, and − 10° at Melrose, on the 17th. Reference was also made in detail to the rivers and lakes which had been frozen over, and to other incidents proving the remarkably low temperatures which had occurred. Some idea of the intensity of the frost may be gathered by the fact that in the south of Scotland the temperature fell below 10° on more than eleven occasions, below 20° on nineteen occasions, and was below 32° on twenty-five to twenty-nine occasions. In the London district readings below 10° occurred on two or three days, below 20° on ten days, and below 32° on twenty days. In Ireland temperatures below 10° were registered on six or seven occasions, below 20° on twelve or fourteen occasions, and below 32° on twenty-two to twenty-four occasions. No place in the British Isles was exempt from the frost, even at Scilly the temperature was below 32° on three days, the lowest being 29° on two occasions. The winter sea-side health resorts afforded no protection from the frost; at Penzance the temperature fell below 32° on ten occasions, at Torquay on eleven occasions, and was below 20° on six occasions. At Ventnor it was below 32° on nineteen occasions, and below 20° on three occasions, and at Bournemouth it was below 32° on twenty-three, and below 20° on ten occasions. The heavy falls of snow prevented the frost from penetrating far into the ground, but where the snow was cleared away the temperature of the soil fell considerably. A diagram was exhibited showing the mean temperature of January, in the neighbourhood of London, for each year, from 1774 to 1881, from which it appeared that the low mean temperature of 31°·6 for last month had only been surpassed on five occasions, and that the three years, 1879-81, have been very cold, the mean for this period being only 32°·2; there is no instance during the past 100 years of any three consecutive Januarys having so low a mean temperature.

Royal Microscopical Society, February 9 (Anniversary Meeting).—Dr. Beale, F.R.S., president, in the chair.—The Report of the Council showed an addition of [illegible] Fellows

during the year (making 611 in all), with a considerable increase in the revenue and capital accounts of the Society. The attendance at the meetings was also shown to have increased by nearly 50 per cent. The President read his annual address, in which he dealt with the theory of evolution. A vote of thanks was passed by the meeting on the occasion of his retirement from the presidency, as also to the retiring treasurer, Mr. J. W. Stephenson.—The following Council was elected for the ensuing year:—President, Prof. P. Martin Duncan, F.R.S.; Vice-presidents: Prof. F. M. Balfour, F.R.S., W. B. Carpenter, C.B., F.R.S., John Millar, L.R.C.P. Edin., John Ware Stephenson; Treasurer, Lionel S. Beale, F.R.S.; Secretaries: Charles Stewart, M.R.C.S., Frank Crisp, LL.B., B.A.; Members of Council: Robert Braithwaite, M.D., Charles James Fox, William H. Gilburt, James Glaisher, F.R.S., A. de Souza Guimaraens, William J. Gray, M.D., John E. Ingpen, John Matthews, M.D., John Mayall, jun., Albert D. Michael, Frederic H. Ward, M.R.C.S., C. Tharters White, M.R.C.S.

Photographic Society, February 8.—J. Glaisher, F.R.S., president, in the chair.—A paper on sensitometers, was read by Leon Warnerke. After alluding to those already existing, he exhibited and explained one of his own, the "standard sensitometer." This consisted of a frame constructed to hold a thin block made of phosphorescent calcium sulphide mixed with paraffin, and made luminous by burning one inch of magnesium ribbon in close proximity; next is a glass, having upon it a series of squares (with consecutive figures on them) increasing in opacity; then a photographic plate, or any other material sensitive to light, is placed in front, and the phosphorescent light is then permitted to pass through the glass containing the squares; and the highest number visible represents the sensitiveness of the matter experimented upon; the numbers enabling relative values to be determined.

Statistical Society, February 15.—Mr. Jas. Caird, C.B., F.R.S., president, in the chair.—A paper was read on the number of deaths from accident, negligence, violence, and misadventure in the United Kingdom and some other countries, by Mr. Cornelius Walford, Barrister-at-Law, wherein he reviewed the numbers and causes of deaths of this class from the earliest periods at which records existed in the United Kingdom, bringing them down also to the latest date, and noting the circumstances which had helped to increase them, as also those which had a retarding influence. He was of opinion, supported by the statistics adduced, that violent deaths of various kinds had advanced with the progress of civilisation. New forces, as also increasing mechanical productiveness, rendered the risk to life and limb continually greater.

PARIS

Academy of Sciences, February 14.—M. Wurtz in the chair.—The following papers were read:—Progress of the zoological station of Roscoff, by M. de Lacaze-Duthiers. Since 1872 there have been 114 workers of various nationalities at the station, the numbers rising from three in 1872 to twenty-seven last year. Last August seventeen were accommodated at once. A keeper now stays at the station constantly, and despatches live animals to various laboratories in France. Zoologists can be lodged in winter. The station has a good sea-going vessel, and is about to acquire a diving-dress. (Particulars of the aquarium, laboratory, &c., are given.) A new station is being formed at Port Vendres, on the Mediterranean.—Existence of large spiral cells distributed in the parenchyma of certain *Crinum*, by M. Trécul.—Theorems relative to the equation of Lamé, by M. Brioschi.—On periodic movements of the ground, by M. Plantamour. In the year ending September 30, 1880, a great lowering took place on the east side, from October 4 to January 28, viz. 95"·80 (as against 28"·08 the previous year). The mean temperature of December was unusually low, but the author thinks some other cause must have operated also. The level placed in the meridian showed nearly the same oscillation as the previous year (4"·56). In winter the south side rises with rise of temperature; in summer it falls.—On the earthquake in Switzerland on Jan. 27, 1881, by M. Colladon.—Lithological and geological examination of the meteorite that fell on Oct. 13, 1872, in the neighbourhood of Soko Banja, in Servia, by M. M. Sunier.—On Fuchsian functions, by M. Poincaré.—On the laws which rule periods and coefficients of intensity in one of the principal groups of elementary electromotive forces due to solar induction, and on the possibility of using the magnetic needle to measure the velocity of rotation of the sun about its axis, by M. Quet.—On the relations which exist between the temperature, pressure and circulation of the air on the Iberian peninsula, by M. Teisserenc de Bort. In winter the peninsula is colder than the seas around; it shows a barometric maximum, the air flowing outwards to the coasts. In summer the isotherms group round a maximum in the middle of Spain, where, on the other hand, the pressure shows a minimum, and the winds tend inwards. In intermediate seasons the isotherms are nearly perpendicular to the meridians; the isobars are grouped uniformly round great centres of atmospheric action, the most important being the oceanic barometric maximum. Spain is somewhat like monsoon countries. (The author also studies the action of the peninsula as revealed in daily phenomena).—On m'boundou (test-poison of the Gaboonese), new physiological, chemical, histochemical, and toxicological researches, by MM. Heckel and Schlagdenhauffen. It contains only one alkaloid, strychnine. The division of *Strychnos* into *tetanising* and *paralysing* is not warranted. The effect depends on the dose employed.—On the treatment of phylloxerised vines by insufflation of vapours of sulphide of carbon, by M. Bourdon. He sends the vapours through a permanent drainage-system.—The Secretary made reference to the death of M. Kuhlmann.—Research on the specific magnetism of ozone, by M. Becquerel. Ozone is found to be more magnetic than oxygen, and the ratio of the one specific magnetism to the other is considerably greater than the supposed ratio of the densities. Thus the specific magnetism of ozone is greater than that corresponding to the quantity of oxygen contained in it.—On the electric phenomena of tourmaline and of hemihedral crystals with inclined faces, by MM. Jacques and Curie.—On the combination of hydrochloric acid with bichloride of mercury, by M. Ditte. These substances may unite in several proportions.—Violet illumination of the retina under the influence of luminous oscillations, by M. Charpentier. If the sky, uniformly illuminated by diffused white light, be looked at steadily, and two fingers (separate about 0·02 m.) passed to and fro rapidly before the eye for about half a minute, one perceives a mosaic system of hexagons of violet purple colour separated by white lines. The author supposes the hexagons to represent the cones in the fovea and yellow spot, and the white lines filaments from the choroidian cells.—Determination of fundamental colour-sensations by study of the distribution of complementary colours in the chromatic circle (continued), by M. Rosenstiehl.—On a glucoside extracted from common ivy, by M. Vernet.—On cultivation of the microbe of rot, by M. Toussaint. This succeeds best in rabbit or mutton bouillon. The microbe appears in two states, that of bacteria and that of spores.—Structure and texture of the ink-bag of Sepia, by M. Girod.—Artificial reproduction of basalts, by MM. Fouqué and Lévy. They followed the igneous method. The peridote was crystallised at a higher temperature than the other minerals. The black earth used consisted of one of olivine, two of augite, and six of labrador.—Map of the central part of the Spanish Pyrenees, by M. Schroder.

LIGHTNING CONDUCTORS.
Experience, accumulated since the time of Benjamin Franklin, proves conclusively that a Conductor made of Copper of adequate size is the best of all appliances for the protection of every description of building from the destructive effects of lightning.

NEWALL & CO.'S
PATENT COPPER LIGHTNING CONDUCTOR,
As applied to all kinds of Buildings and Shipping in all parts of the world with unvarying success, is the most Trustworthy, most Effective, and also the Cheapest Conductor ever offered to the public.
It is simple in its application, no insulators being required, and it costs only one shilling per foot for the standard size, which ensures safety in any storm.

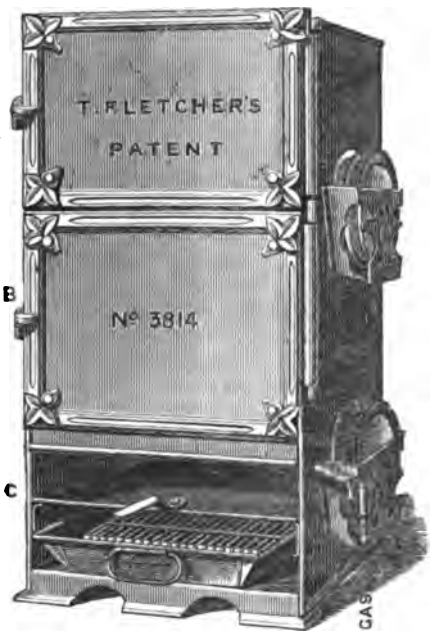
FLETCHER'S
PATENT VENTILATED
HOT-AIR OVEN.

At a cost of less than one halfpenny per hour for gas this oven will grill, roast, toast, bake, warm dishes and plates; and with the assistance of Fletcher's Patent Solid Flame Boiling Burners will do everything possible with a first-rate open fire (except drying clothes on washing days).



It is unapproached by any oven for pastry, and is fully hot in one minute after the gas is lighted.

Fish, joint, and pastry can be cooked all at once, in the most perfect manner, without the slightest taint from one to the other. The cooking is always good and always alike.

It will roast joint and fowls both at once, at least as well as an open fire.

Complete illustrated list of gas cooking and labour-saving appliances free by post. List of Gas and Petroleum Laboratory Furnaces and Apparatus, price 2d

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE

(PRICE 3d. WEEKLY).

The representative organ of the Central and Provincial Chambers of Agriculture; *gives fuller reports of the discussions and proceedings* of this extensive organisation than any other agricultural paper. It devotes *special attention to the treatment of Agricultural Questions by Parliament*, besides containing ample Reports of the LATEST LONDON and COUNTRY CORN, CATTLE, HOP, PROVISION, and other Markets, with Original Articles on Practical Farming, the Dairy, Herd and Flock News, Horticulture, &c., &c. It is despatched every Monday evening in time for the country post.

Terms of Subscription, payable in advance, post free:—3 months, 3s. 9½d.; 6 months, 7s. 7d.; 12 months, 15s. 2d.

Published by W. PICKERING, 21, Arundel Street, Strand, London, W.

On the 1st of every Month.

TRIMEN'S JOURNAL OF BOTANY,

BRITISH AND FOREIGN.

New Series. Edited by JAMES BRITTEN, F.L.S., British Museum.

CONTENTS.—Original Articles by leading Botanists.—Extracts, and Notices of Books and Memoirs.—Articles in Journals.—Botanical News.—Proceedings of Societies

Price 1s. 3d. Subscription for One Year, payable in advance, 12s.

London: WEST, NEWMAN, & CO., 54, Hatton Garden, E.C.

In unserem Verlage erscheint:

DER NATURFORSCHER.

Wochenblatt zur Verbreitung der Fortschritte in den Naturwissenschaften.

Herausgegeben von Dr. WILHELM SKLAREK.

Wochentlich 1—1½ Bgn. in 4°.

Preis vierteljährlich 4 Mk.

Die nunmehr ihren XIV. Jahrgang beginnende Zeitschrift hat bei Allen, welche sich mit Naturwissenschaften beschäftigen, grossen Beifall gefunden.

Probenummern sind durch jede Buchhandlung zu erhalten.

Berlin, S.-W., 77, Charlottenstr.

FERD. DÜMMLER'S VERLAGSBUCHHANDLUNG.

(Harrwitz & Gossmann.)

On the 1st of every Month, price Sixpence.

THE ENTOMOLOGIST:

AN ILLUSTRATED JOURNAL OF BRITISH ENTOMOLOGY.

Edited by JOHN T. CARRINGTON,

With the Assistance of

FREDERICK BOND, F.Z.S. | JOHN A. POWER, M.D.
EDWARD A. FITCH, F.L.S. | J. JENNER WEIR, F.L.S.
F. BUCHANAN WHITE, M.D.

Contains Articles by well-known Entomologists on all branches of the Science; on Insects injurious or beneficial to Farm or Garden; Notes on Habits, Life-Histories; occurrence of Rarities, &c.; there are monthly lists of Duplicates and Desiderata.

Numerous WOODCUT ILLUSTRATIONS, to the printing of which especial attention is given, and occasional LITHOGRAPHED and CHROMO-LITHOGRAPHED PLATES.

SIMPKIN, MARSHALL, & CO., Stationers' Hall Court.

Chaque Samedi 16 pages grand in-8°, 2 colonnes

MACMILLAN'S MAGAZINE

FOR MARCH, 1881.

CONTENTS.

The Portrait of a Lady. By Henry James, Jun. Chapters XXI.—XXIV.
Christmas and Ancestor Worship in the Black Mountain. By Arthur J. Evans. Part III.
Byron. By Matthew Arnold.
Connemara. By Robert J. Martin.
The Penny Press. By Francis Hitchman.
On a Recent Criticism of Mr. Swinburne's. By Alfred Austin.

MACMILLAN & CO., LONDON.

FOR SALE.—A Collection of MINERALS,

the Property of the late Sir W. C. TREVELYAN, Bart.—Apply to S. G. PERCEVAL, Henbury, Bristol.

DRAPER'S INK (DICHROIC).

THE NEW BLACK INK

DIFFERING FROM ANYTHING ELSE EVER PRODUCED.

Writing becomes a pleasure when this Ink is used. It has been adopted by the principal Banks, Public Offices, and Railway Companies throughout Ireland.

It writes almost instantly Full Black. | Flows easily from the Pen.
Does not corrode Steel Pens. | Blotting-paper may be applied at the moment of writing.
Is cleanly to use, and not liable to Blot.

Can be obtained in London, through Messrs. BARCLAY & SONS, Farring-

In course of Publication.

PHILOSOPHICAL CLASSICS for ENGLISH READERS. Edited by Prof. KNIGHT, St. Andrews. In crown 8vo Volumes, with Portraits, price 3s. 6d. each.

This Day is Published, Vol. III.

BERKELEY. By A. Campbell Fraser, Professor of Logic and Metaphysics in the University of Edinburgh.

Vols. I. and II. contain—

DESCARTES. By Prof. Mahaffy, Dublin.

BUTLER. By the Rev. W. Lucas Collins, M.A.

Other Volumes in Preparation.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

This Day is Published.

A MONOGRAPH of the SILURIAN FOSSILS of the GIRVAN DISTRICT in AYRSHIRE. With Special Reference to those contained in the "Gray Collection." By Prof. H. ALLEYNE NICHOLSON, St. Andrews; and ROBERT ETHERIDGE, Jun., Pres. R.P.S., Ed. Vol. I.—The Protozoa, Actinozoa, Crustacea, Annelida, and Echinodermata. Royal 8vo, with 24 Lithographed Plates and other Illustrations on Wood. Price 21s.

Also sold in separate Fasciculi, viz.—

Fasciculus I. (Rhizopoda, Actinoza, Trilobita.) With 9 Lithographed Plates. 7s. 6d.

Fasciculus II. (Trilobita, Phyllopoda, Cirripedia, and Ostracoda.) With 6 Lithographed Plates. 5s.

Fasciculus III. (The Annelida and Echinodermata.) With 9 Lithographed Plates. 7s. 6d.

"A piece of palæontographical work of the very highest character, and we trust that the authors may be encouraged, by the reception it meets with from their *confrères* and the public, to complete it in the same style."—*Popular Science Review.*

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

The CURRENTS of the AIR: Being Weather Forecast for 1881. Price 6d. By D. DEWAR.

JAMES BROWN & SON, 13, Drury Street, Glasgow.

In fcap. 8vo, with 50 Woodcuts, price 1s. 6d., cloth.

EXPERIMENTAL CHEMISTRY FOR JUNIOR STUDENTS. By J. EMERSON REYNOLDS, M.D., F.R.S., Professor of Chemistry, University of Dublin. PART I.—INTRODUCTORY.

"Dr. Reynolds' little manual is an excellent example of the experimental method applied to teaching, and is admirably adapted as a text-book for the use of the lower science classes in schools."—*Chemists' Journal.*

London: LONGMANS & CO.

LATEST EDITION OF GANOT'S PHYSICS.

In large crown 8vo, illustrated by 4 Coloured Plates and 844 Woodcuts, price 15s., cloth.

ELEMENTARY TREATISE on PHYSICS, Experimental and Applied, for the use of Colleges and Schools. Translated and Edited, with the Author's sanction, from GANOT'S "Éléments de Physique" by E. ATKINSON, Ph.D., F.C.S., Professor of Experimental Science, Staff College, Sandhurst. Ninth Edition, Revised and Enlarged.

"This well-known work has been before the public for sixteen years, and has now reached a ninth edition. Each new edition has contained both additions and revisions in accordance with the progress of science. The present edition differs from the last by an increase of subject-matter of twenty-five pages, while twenty-four new illustrations have been added. The illustrations are extremely good, and the various subjects are discussed with a sufficient infusion of mathematics to make the book serviceable for the use of the highest forms in schools and for scholarship and other examinations."—*Academy.*

By the same Translator, in crown 8vo, price 7s. 6d.

GANOT'S NATURAL PHILOSOPHY for GENERAL READERS and YOUNG PERSONS. Third Edition, Revised, with a Coloured Plate and 454 Woodcuts.

London: LONGMANS & CO.

Just Published, royal 8vo, cloth, 25s.

LIGHTHOUSE CONSTRUCTION AND ILLUMINATION. By THOMAS STEVENSON, F.R.S.E., F.G.S., Mem. Inst. C.E., Author of "Lighthouse Illumination," "The Design and Construction of Harbours," &c.

London: E. & F. N. SPON, 16, Charing Cross; New York: 446, Broome Street.

THURSDAY, MARCH 10, 1881

SIR WILLIAM HERSCHEL

I.

ON March 13, 1781, the planet *Uranus* was discovered by William Herschel, and very opportunely at this ntenary of that memorable addition to the planetary stem, Prof. Holden has presented us with a popu- biography of the great astronomer and an outline of works, which he has been careful to make intelligible the general reader.[1]

Of the great modern philosophers, writes Prof. Holden, t one of whom least is known, is William Herschel, l we may appropriate the words which escaped him as of the starless spaces in the constellation Scorpio ssed through the field of his telescope, when his sister roline Herschel, his constant attendant during his ht-watches, tells us he exclaimed, "*Hier ist wahr- tig ein Loch im Himmel.*" A life of Herschel which all be satisfactory in every particular, Prof. Holden iarks, can only be written after a full examination of materials which may have been preserved by the ily; but as two generations have passed since his th, he thinks no apology will be needed for a con- entious attempt to make the best use of material eady in hand, scanty as it may be.

Herschel did prepare, about the year 1818, a biographi- note or memorandum, which was then placed amongst papers, and which has not been made public, and his er, writing in June, 1842, mentions having commenced work which she almost despaired of finishing, "The story of the Herschels," in which presumably her ther's life and work would have formed the main ture, but we do not hear that in her then infirm state health any considerable progress was made with it.

The only authentic sources of biographical information ore the world are in the "Memoir and Correspondence Caroline Herschel," published in 1876, and in a much known sketch of his life furnished by Herschel him- f in a communication to Lichtenberg, dated November 1783, and printed in the *Göttingen Magazine of ience and Literature*, iii. 4; this sketch was forwarded the request of Lichtenberg, when acknowledging the eipt of memoirs on double stars, &c., which Herschel d sent him.

William Herschel was born in Hanover on November , 1738, and was the second son of Isaac and Anna erschel. The musical taste which he exhibited early in appears to have been inherited from his father, who med one of the band of the Hanoverian Guards in 31. The eldest son Jacob was a clever musician, and st violin in the Court orchestra in 1759; he afterwards ned his brother William in this country, and on return- g to Hanover carried on a correspondence with him on usical subjects till his death in 1792. The youngest other Dietrich also shared in the musical abilities of e family, and at fifteen years of age was so far advanced to England, Herschel accompanied them as one of the band, and remained in this country about a year, when he returned to Hanover. During part of the disastrous campaign of 1757 he was on active service with the regiment, but after the defeat at Hastenbeck in July, it became evident that he had not the physical strength for the service, and his parents resolved to remove him. In connection with this circumstance Prof. Holden recalls a statement made by Sir George Airy, that the "removal" was a desertion, as he was told by the Duke of Sussex that on Herschel's first visit to the king after the discovery of the *Georgium Sidus*, "his pardon was handed to him by the king himself, written out in due form."

Herschel returned to England, though at what time does not appear. In fact from 1757 to 1760 we know nothing of his life. It is related in the Memoirs of Caroline Herschel that several pages referring to this period had been torn out in both her original Recollections and in the unfinished Memoir commenced in 1840. In 1760, however, he is again heard of, at Pontefract, as a young German in the band of the Durham militia, who spoke English almost as well as a native, and who was an excellent performer on the violin. It is conjectured that till his appointment as organist at Halifax in 1765, pupils and public concerts must have filled up his time; during a portion of this interval of five years he resided at Leeds, and in April, 1764, we are told he returned to Hanover on a very brief visit. In 1766 he obtained an engagement at Bath, and soon after was appointed organist at the Octagon Chapel. In this year, says Prof. Holden, he began a life of unceasing activity. His engaging manners made him friends, while "his talents brought him admirers and pupils, and pupils brought him money"; at this time he was giving thirty-five or more musical lessons in a week. In August, 1772, he proceeded to Hanover to take back to England his sister Caroline, afterwards his untiring assistant and companion in his surveys of the heavens. At this time his residence was in New King Street, Bath, and here in 1774 he had made himself a Gregorian telescope, probably on the model of Short's. In the preceding year, it is related of him, that he used to retire to bed with Smith's Harmonics and Optics, Ferguson's Astronomy, &c., and his first thoughts on rising were how to obtain instruments for viewing the objects of which he had been reading. We are told no optician had settled in Bath at that time.

Prof. Holden mentions that in *Journal* No. 1, preserved at the Royal Society, is a copy of Herschel's first observation of the nebula of Orion, made with his 5½-feet Gregorian reflector on March 4, 1774. In 1775, with a Newtonian telescope of 4½ inches aperture, and power of 222, also made by himself, he made his first review of the heavens, consisting in the examination of every star of first to fourth magnitudes and the planets; no records of these observations are now known to be in existence. In the same year the first 7-feet reflector was finished, and in 1777 one of 10 feet and one of 20 feet had been projected, and a grass-plot behind a house near Walcot turnpike, to which Herschel had removed at midsummer,

course of time, I took up astronomy, I determined to accept nothing on faith, but to see with my own eyes everything which others had seen before me. Having already some knowledge of the science of optics, I resolved to manufacture my own telescopes, and after many continuous, determined trials, I finally succeeded in completing a so-called Newtonian instrument, seven feet in length. From this I advanced to one of ten feet, and at last to one of twenty, for I had fully made up my mind to carry on the improvement of my telescopes as far as it could possibly be done." A very good twenty-feet reflector was finished in 1783, but the celebrated forty-feet instrument was not commenced until 1785. Herschel tells us in his description of the latter telescope that in all he made "not less than 200 7-feet, 150 10-feet, and about 80 20-feet mirrors, not to mention those of the Gregorian form, or of the construction of Dr. Smith's reflecting microscope," of which he also made a great number.

In or about 1779 Herschel removed to 19, New King Street, which was his last change of residence at Bath, and it was at this house that the planet Uranus was discovered. His first astronomical paper, on the variable star Mira Ceti, was written from thence, and appeared in the *Philosophical Transactions* for 1780: he had previously contributed a paper (his first publication) to the *Ladies' Diary* in 1779, in answer to a prize question proposed by Landen, viz. "the length, tension, and weight of a musical string being given, it is required to find how many vibrations it will make in a given time, when a small given weight is fastened to its middle, and vibrates with it." In the same volume of the *Phil. Trans.* he published observations relating to the mountains in the moon; at this time and subsequently he measured the heights of about 100, on three different methods. Most of these measures were never printed, and as Prof. Holden remarks at this date they would probably be of no material service to science.

His next paper presented to the Royal Society on January 11, 1781, is entitled "Astronomical Observations on the rotation of the Planets round their Axes, made with a view to determine whether the Earth's Diurnal Motion is perfectly equable," a paper which Prof. Holden views as affording the first obvious proof of the truth of the statement made by Herschel thirty years later, when he said, "A knowledge of the construction of the heavens has always been the ultimate object of my observations." It marks too an advance in practical astronomy: not only are the results given, but careful estimates of the errors to which they may be liable is made, with a discussion of the source of such errors.

On March 13 following Herschel made his great discovery of the planet *Uranus*, that *Georgium-Sidus*, as it was his wish it should be called, which made his name at once familiar throughout Europe. The discovery was announced in a paper communicated to the Royal Society on April 26 by Dr. Watson of Bath, an intimate friend of Herschel's, and strange as it may now appear to us, it is entitled "Account of a Comet." His own words referring to the circumstances of the discovery are as follows:—"On Tuesday, the 13th of March, between ten and one that appeared visibly larger than the rest: be struck with its uncommon magnitude, I compared : H Geminorum and the small star in the quartile betw Auriga and Gemini, and finding it so much larger t either of them, suspected it to be a comet. I was t engaged in a series of observations on the parallax of fixed stars, ... and those observations requiring r high powers, I had ready at hand several magnifiers 227, 460, 932, 1536, 2010, &c., all of which I have cessfully used upon that occasion. The power I had when I first saw the comet was 227. From experienc knew that the diameters of the fixed stars are not portionally magnified with higher powers as the pl are; therefore I now put on the powers of 460 and and found the diameter of the comet increased in pro tion to the power, as it ought to be, on a supposition its not being a fixed star, while the diameters of the s to which I compared it were not increased in the s ratio. Moreover, the comet being magnified much bey what its light would admit of, appeared hazy and defined with these great powers, while the stars preser that lustre and distinctness which from many thou observations I knew they would retain." The obser tions given in this paper extend to April 19, and Hers adds he was "happy to surrender it to the care Astronomer-Royal" (Dr. Maskelyne) and others as soo he found they had begun their observations upon little idea had he six weeks after he first glimpsed object of the great discovery he had made.

It is certain that at the date of this discovery the n of Herschel was unknown to the principal astrono on the Continent, and it is almost ludicrous to re the various guesses that were made respecting it. Holden transcribes the amusing passage from account of the discovery of *Uranus*: "In the *Littéraire* of June, 1781, this worthy man is MERSTHEL; in Julius' *Journal Encyclopédique*, SCHEL; in a letter from Mr. Maskelyne to M. Mes HERTHEL; in another letter of Maskelyne's to Herr at Manheim, HERRSCHELL [doubtless mis-reading Darquier calls him HERMSTEL. What may his name He must have been born a *German*." In the first no of the discovery in the *Connaissance des Temps* he is ca HOROCHELLE.

The telescope which Herschel was using on the even of March 13, 1781, was that with which his second re of the heavens was made, a reflector[1] of 85·2 inches f 6·2 inches aperture, and power, 227. This survey writes in 1783, "extended to all the stars of Harris's ca and the telescopic ones near them, as far as the eighth ma nitude. The catalogue of double-stars and the discov of the *Georgium Sidus* were the results of that review

Arago says if Herschel had directed his telescope towa the constellation Gemini eleven days earlier (March instead of March 13) the proper motion of the pla would have escaped him, for the planet was on the near one of its stationary points, and adds, "On par cette remarque à quoi peuvent tener les plus gran découvertes astronomiques." This implies a total conception of the case: as Prof. Holden remarks:—"

[1] When Sir John Herschel contemplated presenting one of his fa

new planet was detected by its appearance and not by its motion." Herschel, referring to his discovery in his communication to Lichtenberg, says: "This was by no means the result of chance, but a simple consequence of the position of the planet on that particular evening, since it occupied precisely that spot in the heavens which came in the order of the minute observations that I had previously mapped out for myself. Had I not seen it just when I did I must inevitably have come upon it soon after, since my telescope was so perfect that I was able to distinguish it from a fixed star in the first minute of observation." It is not to be supposed that so striking an object would have been viewed once and forgotten, even if no motion were immediately detected.

As is well known, Herschel feeling deeply his indebtedness to the liberality of George the Third, desired to testify his gratitude by giving his planet a name which would mark the epoch of its discovery, and in his letter on the subject addressed to Sir Joseph Banks, then President of the Royal Society, writes, "I cannot but wish to take this opportunity of expressing my sense of gratitude by giving the name Georgium Sidus,

Georgium Sidus
——jam nunc assuesce vocari,

to a star, which (with respect to us) first began to shine under his auspicious reign."

Prof. Holden dwells upon the changes which may be considered to have been effected in the state of astronomy not only in England but in the whole world, simply by the discovery of Uranus. "Herschel's researches would have gone into the *Philosophical Transactions* as the work of an amateur astronomer, Mr. Herschel, of Bath. They would have been praised and they would have been doubted. It would have taken a whole generation to have appreciated them. They would have been severely tried, entirely on their merits, and finally they would have stood where they stand to-day—unrivalled. But through what increased labours these successes would have been gained! . . . Certainly, if Herschel's mind had been other than it was, the discovery of Uranus, which brought him honours from every scientific society in the world, and which gave him authority, might have had a hurtful effect. But as he was, there was nothing which could have aided his career more than this startling discovery. It was needed for him. It completed the solar system far more by affording a free play to a profoundly philosophical mind, than by occupying the vacant spaces beyond Saturn. His opportunities would have been profoundly modified, though his personal worth would have been the same." We think there are few astronomers who will not be able to follow Prof. Holden in the views he has thus forcibly expressed.

At the hands of Sir Joseph Banks, Herschel received the Copley Medal of the Royal Society in 1781, for his "discovery of a new and singular star," and was formally admitted a Fellow of the Society on May 30, 1782. It was during this visit to London that Herschel was received by the king, and as he wrote to his sister the same day, met with a very gracious reception. Prof. Holden reproduces from the Memoirs of Caroline Herschel his letter of July 2, in which he describes his general satisfaction; the king in particular, he states, "enjoys observations with telescopes exceedingly." Herschel returned to Bath in the last week of July, and immediately prepared for removing to Datchet.

Here, at the end of his second chapter, we close our present notice of Prof. Holden's welcome volume, reserving for another week his third chapter on "Life at Datchet, Clay Hall, and Slough," and the concluding one on the general scientific labours of Herschel. It should be stated that while taking Prof. Holden's work as our text, particulars have been included in this notice which are not specially referred to in it, in view of the interest attaching to them at the present time, when, as stated above, a hundred years have elapsed since Herschel's discovery of *Uranus* doubled the known extent of the planetary system.

J. R. HIND

EXTINCT BRITISH ANIMALS

British Animals Extinct within Historic Times; with some Account of British Wild White Cattle. By J. E. Harting, F.L.S. (London: Trübner, 1880.)

THE wild animals formerly inhabiting Britain, which disappeared before the advance of the hunter and farmer in historic times, have hitherto only been treated in a disconnected fashion, in essays scattered through various periodicals, or in portions of books relating to other subjects. Mr. Harting has collected together in the present volume his own essays in the *Field* and in the *Popular Science Review*, and has brought to bear upon his subject a knowledge of records, and an acquaintance with sport, which render his work extremely valuable. His references are accurate, and he has availed himself of nearly every source of information. Consequently we have before us a work dealing with the bear, wolf, beaver, reindeer, and "wild cattle," worthy to be classed between Bell's "British Quadrupeds" on the one hand, and White's "History of Selborne" on the other, relating not merely to the animals, but to the forests in which they lived and to the mode in which they were hunted.

The common brown bear made its appearance on the Continent in the Pleistocene age, and crossed over to Britain while the areas of the North Sea and of the English Channel were fertile valleys abounding in animal life. Its remains occur both in the river-deposits and in the caves, and have been met with in the turbaries and alluvia of England and of Scotland, which belong to the prehistoric period. It was hunted by the Neolithic inhabitants of Britain, and used for food by the inhabitants of Colchester and Richmond in Roman times. From the "Penitentiale" of Archbishop Egbert (A.D. 750), in which the flesh of any animal torn by dog, wolf, fox, or bear, or any other wild animal is forbidden to be used for human food, it is clear that it was alive in this country at that time. In the days of Edward the Confessor Norwich furnished annually one bear to the king and six dogs for the baiting of it. This however does not prove the existence of wild bears in Britain at that date, because bear-baiting was almost a national sport among the English until bears became too costly and the public taste too refined for such brutal exhibitions. Fitz-Stephen tells us, in the

season with boar-fights, or bull- and bear-baiting. A grand exhibition of bear-baiting took place at Hatfield House when Queen Mary visited her sister, the Princess Elizabeth, during her confinement there, "with which their Highnesses were right well content." Soon after the ascension of the latter to the throne she entertained the Spanish ambassadors with bulls and bears, and some years afterwards she received the Danish ambassador at Greenwich, and entertained him with bear-baiting, "tempered with other merry disports." On one occasion at Kenilworth no less than thirteen bears were baited before the queen with large ban-dogs. From these notices it is evident that Queen Elizabeth was very fond of this sport. Some of the great nobles and ecclesiastics also kept bears and bear-wards. Latterly there were travelling bear-wards dependent upon their patrons. The bear was probably extinct in Britain about the time of the Norman Conquest, and is not known to have existed in Ireland within the historic period.

The wolf abounded in Britain in the Pleistocene and prehistoric periods, and varied in numbers in the historic age in proportion to the waste lands. It was a subject of many legal enactments, and grants of land were held for its capture. To the numerous references which Mr. Harting gives we may add an extract from the Litany of Dunkeld current in Scotland in the eleventh or twelfth century: "A cateranis et latronibus, a lupis et omni mala bestia, Domine, libera nos."

The animal had a price set upon its head by statute in 1621; the price paid for one wolf in Sutherlandshire was six pounds, thirteen shillings, and fourpence. In Ireland, in 1683, "for every bitch wolfe the price was six pounds, for every dog wolfe five pounds, for every cubb which preyeth for himself forty shillings, and for every suckling cubb ten shillings." It is obvious from these large prices that the wolf was becoming rare in Scotland and Ireland in the middle of the seventeenth century. The last of the British wolves was killed in Scotland in 1743 by MacQueen, a man remarkable for his stature and courage, who died in the year 1797. The memory of the exploit is still preserved by tradition. In Ireland the animal lingered until 1770. Mr. Harting deserves great credit for having collected together the evidence by which these dates can be fixed. The wolf became extinct in England in the reign of Henry VII.

The wild boar still lingered in Lancashire in 1617, and the last notice of the animal in the south of England is of the hunting of the wild boar at Windsor by James I. and his court. Mr. Harting considers that an entry in an account book of the steward of the manor of Chartley "1683.—February. Pd. the cooper for a paile for ye wild swine, 0 . 2 . 0.," proves that it was not extinct in England at that date. It seems however to us very unlikely that wild boars would have such attention paid to their wants, and more probable that they were domestic swine turned out into the woodlands to get the greater part of their own living.

Notes of Observations of Injurious Insects. N... 1880. By Eleanor A. Ormerod. 8vo. pp. ... (London: W. Swan Sonnenschein and Allen. ... burgh: J. Menzies, 1881.)

MISS ORMEROD and her assistants are to be con... lated on this very excellent Report, which is fa... bulky than its predecessors, and correspondingly ... and interesting, and well illustrated. At the ... a very significant fact is mentioned. The s... of 1880 was remarkably suitable for vegetation, an... attacks of insects consequently less severe; a high ... tion of vitality enabled the plants to more succes... cope with their insect enemies. The most ... species for the year was the well-known larva of ... (daddy-long-legs), which not only attacked its ... usual food, the roots of grasses, but proved ex... tremely injurious to peas, so that in one field of ... acres the prospective value in March was reduce... realised value of only about one half in June. ... crops were also attacked. Stimulating remedies ... as guano, salt, ammoniacal liquor, &c., had a good e... but the grubs appeared to be remarkably inse... to ordinary poisonous solutions. An experiment m... Kew Observatory as to the amount of cold they can en... showed that some survived 42° of frost. Another ... injurious species was *Tephritis onopordinis* (the celery ... a dressing of gas-lime, unslaked lime, and soot had a ... effect. The singularly misnamed *Psila rosæ* (the c... fly) was also obnoxious; sowing the seeds in a mi... of leaf-mould, ashes, &c., proved of excellent servi... this case. *Sitones lineatus* was very injurious to ... We think Miss Ormerod acts injudiciously in calling ... insect the "pea-weevil." Its larva is certainly very ... given to attacking peas and many other plants, by ea... the young shoots, but the true pea-weevil is *Bruchus* ... which destroys the peas themselves by feeding inside ... For the gooseberry saw-fly nothing proved so effectu... digging out the earth round the bushes when the l... and pupæ are underground, the removed portion ... taken away and burnt; a suggestion that if pre... woollen cloth be placed on the bushes the parent fly ... deposit her eggs thereon seems far-fetched. Miss ... merod has great faith in the efficacy of paraffine. ... future it is proposed to extend the Report to insects ... hitherto specially mentioned as desirable for observa... We ...

Mémoires de la Société des Sciences Physiques et Naturelles de Bordeaux. 2e série, tome iv., 1me cahier. (Paris: Gauthier-Villars, 1880.)

THIS number contains Conférences de Géométrie supérieure by M. Saltel, in which is given an exposition of the method of analytical correspondence with two applications, the object of the one being to find the number of common solutions in k equations between k unknowns, and of the other to find the degree of a geometrical locus defined by certain algebraic conditions. The methods employed are based on that of M. Chasles's "Principe de Correspondance." The next paper, by M. Imchenetsky, "Détermination en fonction des coordonnées de la force qui fait mouvoir un point matériel sur une section conique," is an interesting one, and is founded upon a remark of M. Bertrand's ("Sur la possibilité de déduire d'une seule des lois de Kepler, le principe de l'attraction, *Comptes rendus*, April 2, 1877), "il serait intéressant de résoudre la question suivante. En sachant que les planètes décrivent des sections coniques, et sans rien supposer de plus, trouver l'expression des composantes de la force qui les sollicite en fonction des coordonnées de son point d'application." The author arrives at his result by taking his equation in the form—

$$px^2 + qy^2 + 2rxy = (ax + by + c)^2.$$

Prof. Teixeira of Coimbra has a short note "Sur les principes du calcul infinitésimal," which calls for no special comment. Dr. G. Sous follows with what appears to us a good article entitled "Phakomètre et Optomètre." For the uninitiated "Les phakomètres sont des instruments destinés à mésurer la distance focale d'une lentelle quelconque." The principle of construction of Silbermann's and of Snellen's is, when an object is placed at twice the focal distance from a converging lens, the real image of the same size as the object is situated also at double the focal distance from the lens. The objection to Silbermann's appears to be its length, which renders it awkward to carry, and to Snellen's that it is not applicable to diverging lenses.

Dr. Sous gives a form which is not liable to either of these defects, and the construction of which is based upon a physical theory, not hitherto, he states, applied to these instruments; but we must refer those interested in optics to the paper itself (fourteen pages in length). The rest of the book is devoted to "Morphologie de la membrane de Schrapnell," Dr. Coyne; "Études d'Optique Physiologique; Influence du Diamètre de la Pupille et des Cercles de Diffusion sur l'acuité visuelle," Dr. Badal; "Les Températures de la Mer dans l'estuaire Girondin et à Arcachon en décembre, 1879, et janvier, 1880," M. Hautreux; "Des Os et de leur Emploi dans la Fabrication du noir Animal, du Suif, du Sulfate d'ammonique, des Boutons," &c., M. Huyard.

LETTERS TO THE EDITOR

[The Editor does not hold himself responsible for opinions expressed by his correspondents. Neither can he undertake to return, or to correspond with the writers of, rejected manuscripts. No notice is taken of anonymous communications.

The Editor urgently requests correspondents to keep their letters as short as possible. The pressure on his space is so great that it is impossible otherwise to ensure the appearance even of communications containing interesting and novel facts.]

Aberration of Instinct

CASES of individual variations of instinct are of importance in relation to Mr. Darwin's theory of the development of instincts by natural selection. Under the belief that aberration of instinct may be regarded as a case, more or less extreme, of variation, I originally from Sussex, and had lived, respected and admired, to see their children of the third generation, when he suddenly became the victim of the infatuation I am about to describe. . . .

"No eccentricity whatever was remarked in his conduct until one day I chanced to pick up somewhere in the garden a ginger-beer bottle of the ordinary brown stone description. I flung it into the yard, where it fell immediately below the pigeon house. That instant down flew paterfamilias, and to my no small astonishment commenced a series of genuflexions, evidently doing homage to the bottle. He strutted round and round it, bowing and scraping and cooing and performing the most ludicrous antics I ever beheld on the part of an enamoured pigeon. . . . Nor did he cease these performances until we removed the bottle; what proved that this singular aberration of instinct had become a fixed delusion was this, whenever the bottle was thrown or placed in the yard—no matter whether it lay horizontally or was placed upright—the same ridiculous scene was enacted; at that moment the pigeon came flying down with quite as great alacrity as when his peas were thrown out for his dinner, to continue his antics as long as the bottle remained there. Sometimes this would go on for hours, the other members of his family treating his movements with the most contemptuous indifference, and taking no notice whatever of the bottle. At last it became the regular amusement with which we entertained our visitors, to see this erratic pigeon making love to the interesting object of his affections, and it was an entertainment which never failed, throughout that summer at least. Before next summer came round he was no more."

GEORGE J. ROMANES

Prehistoric Europe

A FEW last words with Prof. Dawkins, and I have done:—

1. Having discovered that a certain absurd opinion which he attributed to me is nowhere to be met with in the volume he was supposed to be criticising, Mr. Dawkins now imagines that he has found grounds for his assertion in my "Great Ice Age," written and published some years ago. Here again he is quite mistaken. The passage cited by him, even if it be considered apart from its context, will not bear the interpretation he puts upon it. Had he read the page he quotes from with intelligent attention he would have seen that I was referring to the well-known fact that the ossiferous and Palæolithic gravels of East Anglia are represented in the North by the equivalent ossiferous *Cyrena*-beds near Hull, which dovetail with and are overlapped by glacial deposits. In other words, they rest upon a *lower*, and are covered by an *upper* boulder-clay. But I have nowhere said, nor would any candid reader infer from what I have written, that this upper boulder-clay (that of Hessle) ever extended south so as to cover the Palæolithic gravels throughout East Anglia. I am surprised that a professor of geology does not apparently understand the meaning of the term "overlap." Were I to state that in certain districts in Scotland the Carboniferous strata are overlapped by a conformable series of Red Sandstones, should I be understood to imply that these Red Sandstones formerly covered the entire area now occupied by the Carboniferous rocks of Great Britain?

2. Mr. Dawkins has accused me of having suppressed evidence which told against my views, and he now repeats this offensive accusation, citing in justification my description of the Victoria Cave, from which, he says, I have omitted all reference to the discovery of reindeer in the lower cave-earth. Now it is not true that I have ignored this alleged discovery, for I remark that "it seems doubtful whether the remains of that animal, said to have been obtained from the lower earth, really belonged to that deposit." My reasons for this doubt (which I share with other geologists) I did not consider it necessary to give, but they are simply these:—

(1) The explorations in the cave were carried on at first, under Mr. Dawkins's superintendence, by means of shaft-digging, a very unsatisfactory system of "cave-hunting," and one which, even with the most conscientious care, is liable to give false results.

(2) During the subsequent prolonged and scientifically-conducted explorations no recognisable reindeer remains were ever obtained in the lower stratum. These facts alone are sufficient to justify my scepticism. I quite agree with Mr. Dawkins

enough commingled in one and the same accumulation. It is to account for this remarkable commingling that a large portion of my book was written.

3. Mr. Dawkins seems to be ignorant of the fact that the ossiferous deposits of Mont Perrier occur on two separate and distinct horizons. The *lower* bed, characterised by the presence of *Mastodon arvernensis* and other extinct forms, is unquestionably true Pliocene. It is overlaid by the "puniceous conglomerate," with its far-transported and glacially-striated erratics. Upon the denuded surface of this well-marked morainic accumulation rests the *upper* bed, which contains a very different mammalian fauna—*Elephas meridionalis, Rhinoceros leptorhinus* (Cuv.), hippopotamus, tapir, horse, cave-bear, hyæna, hedgehog, &c. The flora associated with this fauna is not Pliocene but Pleistocene. The upper bed is overlaid in turn by a newer set of glacial moraines and erratics. The list of Upper Pliocene Mammalia from Mont Perrier and Issoire, given by Mr. Dawkins in his "Early Man in Britain," consists of a "hash-up" of the species derived from those two separate and distinct horizons.

4. The most recent list of mammalia from the lignite-beds of Leffe and Borlezza is quoted by me from Prof. Stopanni, on the authority of Dr. Forsyth Major. All the species in that list, without exception, have frequently occurred in Pleistocene beds, the age of which is generally admitted. The plants and shells associated with these species are all likewise Pleistocene forms. Moreover, as Stopanni has demonstrated, and as I can testify, the stratigraphical evidence proves that the beds pertain to the Glacial series. Prof. Mayer, no mean authority, has shown that the upper beds of the so-called Pliocene of the Val d' Arno (containing *Elephas meridionalis* and hippopotamus) are not the equivalents of the marine Pliocene, as has hitherto been the belief of palæontologists, but must be classified as Quaternary or Pleistocene.

5. All that I say with regard to the age of the skull of Olmo occurs on p. 318 of my book, and what I say is simply this, "It pertains to Pleistocene times—to the period during which *Elephas meridionalis* belonged to the European fauna." I do not assert its Interglacial age. It may be either Preglacial (*i.e.* early Pleistocene) or Interglacial as the Leffe beds are.

I was not aware that geological classification is always based on zoology alone. I am under the impression that botanical evidence, when it can be obtained, is not despised, and that stratigraphical and other physical evidence is not usually ignored. In trying to work out the historical geology of the Pleistocene, I have considered the palæontological as fully as the physical evidence. Mr. Dawkins would have me rest contented with that of the mammalia alone, as interpreted by himself.

Perth, February 19. JAMES GEIKIE

As my name has been imported into the controversy between Prof. Dawkins and Dr. James Geikie, will you kindly permit me to state that I am quite prepared, after re-reading the account given by Dr. Geikie of the Victoria Cave, to accept all responsibility for its correctness.

Without entering into the general question, in the particular case of the Victoria Cave the evidence for the contemporaneity in the same area of the reindeer and hippopotamus is not very cogent; a review of all the evidence from that source indeed points the other way. The specimen mentioned by Prof. Dawkins was, according to his Report,[1] found in digging a shaft, a method of exploration unfortunately at that time (1872) employed by the Committee. The subsequent explorations, which were not conducted in this manner, but by carefully removing the deposits, layer by layer, to prevent any possibility of accidental mixture of the remains, gave abundant evidence of reindeer in the upper beds, but not any satisfactory evidence of its presence in the lower beds, containing *Hippopotamus, Elephas antiquus, Rhinoceros leptorhinus*, &c. This is a point, amongst others, to which, as Reporter to the Committee, I paid careful attention, and the details were impartially given in the Reports.[2] The absence of reindeer from a lower bed, the only one containing the same fauna in the Creswell caves explored by the Rev. M. Mello and Prof. Dawkins, is worthy of note as bearing on the same subject.

As regards the evidence for the antiquity of man from the he "has only called those witnesses which count on his Prof. Dawkins, in dismissing the whole of this evide "founded on a mistake," must be aware that he is using venient formula which can only apply fairly to a part of doubtfulness of which has already been fully conceded entirely shelves other evidences which are the result of and careful exploration.[1]

To state that he doubts their cogency would be to course of which no one would complain; but to say as a matter of general agreement that they are "founded mistake," looks like an attempt to stifle discussion.

But his remarks are so obviously polemical that t geologists they will probably carry more amusement conviction than the writer contemplated.

Hastings, February 19 R. H. TIDDEM

Les lettres d'Outre-mer

IN the Notes, published in NATURE of January 13, the last paragraph gives, as a fact, an announcement simplest post-office in the world" in Magellan Straits, existence.

At least fourteen years ago there was published account of this unique establishment by the most emine living French writers, M. Victor Hugo, who introduces cumstance into his famous work of fiction, "Les Trav de la Mer"; and ever since reading the account I have wa where the great author obtained his circumstantial relati refers to the year 1823. Nor can I believe that such of oceanic exchange ever really was in existence, at least spot indicated, for a very good reason; that at the poi cated, viz. the neighbourhood of Port Famine, when the was there in 1834 (see Darwin's "Naturalist's Voyage," xi.), "the Fuegians twice came and plagued" the crew; an open barrel would hardly be safe. Darwin, also, who Mount Tarn, the most elevated point in this district, wou have mentioned this famous barrel post-office, had it exis

I am therefore curious to know whence the note in N was compiled, but I fancy the account is apocryphal. Th were however other oceanic post-offices somewhat s principle is a fact in reality.

In 1673 Ascension was visited by the Dominican F Navarette, who speaks of it then as the "*Sailor's Pos* "Mariners of all nations being accustomed at that time letters here, sealed up in a bottle, in a certain known some rock, to be taken away by the first ship which pass opposite direction" (Mrs. Gill's "Six Months in Asce p. 61). And again in 1769 we find the following extract

"1769, *Feby.*

"Ascension island.

Bougainville.

Louis de Bougainville, Colonel of Foot and Commodore Expedition in the Frigate *La Boudeuse*.

Arrd. and anchored in the North-west creek or '*Cro Mountain of the Cross.*'

Anchorage according to Abbé la Caille.

7° 54′ s.—16° 19′ west, of Paris.

Variation 9° 45′ NW.

Three creeks caught turtle.

N.E. creek. N.W. creek. English creek, S.W.

"In the afternoon the bottle was brought to me which tains the paper whereon the ships of every nation generally their name, when they touch at Ascension Island.

"This bottle is deposited in a cavity of the rocks of th where it is equally sheltered from rain and the spray of the In it I found written the *Swallow*, that English ship Captain Carteret commanded, and which I was desirous of ing.[2] He arrived here the 31st of January, and set sail on the 1st of February; thus we had already gained six upon him, after leaving the Cape of Good Hope. I inver the *Boudeuse* and sent back the bottle."

At page 4 of Melliss' "Account of St. Helena (187 wood-cut of the South Atlantic Post Office of 1645. Spea of the island of St. Helena. Mr. Melliss says:—

nglish; and Portuguese authority seems to have been lessened, rough that Power being interested in acquiring possessions lsewhere, and the island was for a while deserted, though still sed by the captains and crews of ships as a South Atlantic ost-office. It was customary to place letters under huge oulders of stone, marked in a conspicuous manner, so that ie crews of ships returning from India might obtain news om home. An interesting record of this period is still to be en on a rude block of lava measuring nearly five feet high and vo feet six inches wide, which has been preserved by being ubsequently built into a large mass of masonry in the James-own burial-ground."

In the Galapagos Islands there is a bay named Post-Office ay, which seems to indicate an analogous nautical exchange ation.

I subjoin Victor Hugo's description, and shall be much bliged to any of your readers who can refer me to any ac-ount of the earlier voyagers whence this scene was derived.

S. P. OLIVER

2, Eastern Villas, Anglesey, Gosport, February 28

P.S.—If any one can give me a reference, also, where I can nd an account of the wreck of the *Grosvenor* on the south-east ast of Africa in 1782, I shall be extremely obliged.

"*Les Travailleurs de la Mer*, édition illustrée (1866). Livre nquième, ix.

—Renseignement utile aux personnes qui attendent, ou raignent, des lettres d'outre-mer" (p. 91).

"Ne disiez-vous pas, Capitaine Gertrais que la *Tamaulipas* ne élâchera point?

—Non. Il va droit au Chili.

—En ce cas il ne pourra pas donner de ses nouvelles en route.

—Pardon, Capitaine Clubin. D'abord il peut remettre des épêches à tous les bâtiments qu'il rencontre faisant voile pour urope.

—C'est juste.

—Ensuite il a *la boite aux lettres de la mer.*

—Qu'appelez-vous la boite aux lettres de la mer?

—Vous ne connaissez pas ça, Capitaine Clubin?

—Non.

—Quand on passe le detroit de Magellan.

—Eh bien?

—Partout de la neige, toujours gros temps, de vilains mauvais ents, une mer de quatre sous.

—Après?

—Quand vous avez doublé le cap Monmouth.

—Bien. Ensuite?

—Ensuite vous doublez le cap Valentin.

—Et ensuite?

—Ensuite vous doublez le cap Isidore.[1]

—Et puis?

—Vous doublez la pointe Anna.[1]

—Bon. Mais qu'est ce que vouz appelez la boite aux lettres le la mer?

—Nous y sommes. Montagnes à droite, montagnes à gauche. Des pingouins partout, des pétrels-tempêtes. Un endroit terrible. Ah! mille saintes mille singes! Quel bataclan, et comme ça tape! La bourrasque n'a pas besoin qu'on aille á son secours. C'est là qu'on surveille la lisse de hourdi! C'est là qu'on diminue la toile! C'est là qu'on te vous remplace la grande voile par le foc, et le foc par le tourmentin! Coups de vent sur coups de vent. Et puis quelque-fois quatre, cinq, six jours de cape sèche. Souvent d'un jeu de voiles tout neuf il vous reste de la charpie. Quelle danse! des rafales à vous faire sauter un trois-mâts comme une puce. J'ai vu sur un brick anglais, le '*True Blue*,' un petit mousse occupé à la '*gibboom*' emporté à tous les cinq cent mille millions de tonnerres de Dieu et la '*gibboom*' avec. On va en l'air comme des papillons, quoi! J'ai eu le contre-maître de la *Revenue*, une jolie goëlette, arraché de dessus le *fore-crosstree*, et tué roide. J'ai eu ma lisse cassée, et mon serre-gouttière en capilotade. On sort de là avec toutes ses voiles mangées. Des frégates de cinquante font eau comme des paniers. Et la mauvaise diablesse de côte! Rien de plus bourru. Des rochers déchiquetés comme par enfantillage. On qu'on a doublé la pointe Anna on voit sur un caillou de cent pieds de haut un grand bâton. C'est un poteau qui a une barrique au cou. Cette barrique, c'est la boîte au lettres. Il a fallu que les anglais écrivent dessus: POST OFFICE. De quoi se mêlent ils? C'est la poste de l'océan; elle n'appartient pas à cet honorable gentleman, le roi d'Angleterre. Cette bôite aux lettres est commune. Elle appartient à tous les pavillons. POST OFFICE, est-ce assez chinois? Ça vous fait l'effet d'une tasse de thé que le diable vous offrirait tout à coup. Voici maintenant comment se fait le service. Tout bâtiment qui passe expédie au poteau un canot avec ses dépêches. Le navire qui vient de l'Atlantique envoie ses lettres pour l'Europe, et le navire qui vient du Pacifique envoie ses lettres pour l'Amérique. L'officier commandant votre canot met dans le baril votre paquet et y prend le paquet qu'il y trouve. Vous vous chargez de ces lettres-la; le navire qui viendra après vous se chargera des vôtres. Comme on navigue en sens contraire, le continent d'ou vous venez, c'est celui ou je vais. Je porte vos lettres, vous portez les miennes. Le baril est bitté au poteau avec une chaîne. Et il pleut! Et il neige! Et il grêle! Une fichue mer! Les satanicles volent de tous côtés. Le *Tamaulipas* ira par là. Le baril a un bon couvercle à charnière, mais pas de serrure ni de cadenas. Vous voyez qu'on peut écrire à ses amis. Les lettres parviennent.

—C'est très-drôle, murmura Clubin rêveur."

Explosive Gas in a Lake

A FRIEND, on whom I can rely, informs me that during the late frost, Loch Ken in Kirkcudbrightshire was frozen over, affording pastime to curlers and skaters. Here and there, however, small spots of the surface, near to the shore, resisted the frost longer, and when they did freeze the ice was very thin. These pot-holes were dangerous to skaters, the largest being about size enough to admit an ordinary curling stone. Gas was emitted from them, and when the ice for the first time was formed over them one person got his face severely burned by boring a small hole in the thin ice and setting fire to the gas thus liberated, with a match. After a while the gas seemed to lose its power of combustion and the experiment could be repeated with impunity, a feeble flame only being evoked, when the hole was first drilled.

J. SHAW

Dumfriesshire, March 4

Colours of British Butterflies

THE sober colouring of the under-wings of many of our butterflies is universally accepted as being "protective." Let the gorgeous "peacock," for instance, but close his wings, and it takes a sharp eye to see him. Why then should he and so many other kinds flaunt their most brilliant hues in the brightest sunshine, and often be rendered even more conspicuous by perching on a yellow flower? One would think that this was the exact way to attract birds, especially as the colours are not likely to be "warning" ones, for if so, why the sober hues of the under sides of the wings? The colours can hardly be "warnings" to particular kinds of birds and "protective" against the attacks of others. The explanation may be that the facilities for recognition, and thus for the continuation of the species, are so much greater in bright light, as to render it advantageous on the whole to run the chance of easier capture in the brighter parts of the day: or it may be that relatively few birds feed at the times that butterflies choose to display their beauties.

In watching butterflies it appears clear that they are, so to speak, shortsighted, for it is the commonest thing possible to see two entirely different sorts circle round each other for some time as if they had to decide whether they are of the same kind or not. In doing this it will be observed that they fly, as it were, over and over each other, so that for quite half the time the gambols are going on, the dark side of the "protected" kinds is shown to the insect below. There steps in a provision which seems admirably adapted for enabling recognition to take place. It will be found that though the wings of protectively coloured butterflies appear very dark at a casual glance, yet that

coloured under-wings. Of these fifteen all have some more or less transparent spaces or colourings. In some cases portions of the under-wings are brightly coloured, though not transparent, but both in this case and when there are transparent places they appear chiefly on parts that are apparently invisible when the wings are closed. If these observations are correct, the insects are carefully protected when at rest or when they are laying their eggs. Whether they pair on the ground or with shut wings I do not actually know, for after carefully watching every butterfly I have come across for two summers, I have not succeeded in seeing any of the protectively coloured sorts pairing. It seems likely enough therefore that their protective colours come into play then. My opportunities for observation are however extremely limited, and it is to draw the attention of those more favourably situated to the subject of the colours of our common butterflies that I write this. In the fifteen protectively-coloured butterflies mentioned above I did not include the "fritillaries," because of the strange metallic lustre on their under-wings. Still they seem suddenly to disappear when they settle, and the metallic spots may take the place of the transparent or coloured ones in other sorts by throwing off the light, and thus enable the insects to recognise each other. Eight kinds more or less transparent but not seemingly protectively coloured, and two common "Blues," make up the thirty kinds I have been able to handle. The under-wings of the "Blues" are certainly protectively coloured, but there seems to be no transparency or bright markings in them.

J. INNES ROGERS

Putney, February 24

Dust, Fogs, and Smoke

THE present endeavours to alleviate the smoke nuisance in London give some interest to the description of the effects of coal smoke on London life in former ages.

I do not mean to speak of the well-known petition presented to Edward the First by the nobility and gentry against the use of sea-coal in London and the consequent proclamation of that monarch interdicting its use. But I allude to the following lines written and published by Evelyn in 1661 in his "Fumifugium," but which I borrow from the "History of London," by Noorthouck, London, 1773.

"The immoderate use of, and indulgence to sea-coale alone in the city of London, exposes it to one of the fowlest inconveniences and reproaches, that can possibly befall so noble, and otherwise incomparable city: and that, not from the culinary fires, which for being weak and lesse often fed below, is with such ease dispelled and scattered above, as it is hardly at all discernible, but from some few particular tunnells and issues, belonging only to brewers, diers, lime-burners, salt, and sope-boylers, and some other private trades one of whose spiracles alone, does manifestly infect the aer, more than all the chimnies of London put together besides. And that this is not the least hyperbolie, let the best of judges decide it, which I take to be our senses: whilst these are belching it forth their sooty jaws, the city of London resembles the face rather of Mount Ætna, the court of Vulcan, Stromboli, or the suburbs of hell, than an assembly of rational creatures, and the imperial seat of our incomparable monarch. For when in all other places the aer is most sereue and pure, it is here ecclipsed with such a cloud of sulphure, as the sun itself, which gives day to all the world besides, is hardly able to penetrate and impart it here; and the weary traveller, at many miles distance, sooner smells, than sees the city to which he repairs. This is that pernicious smoake which sullyes all her glory, superinducing a sooty crust, or furr upon all that it lights, spoyling the moveables, tarnishing the plate, gildings, and furniture, and corrodding the very iron bars and hardest stones with those piercing and acrimonious spirits which accompany its sulphure; and executing more in one year than exposed to the pure aer of the country it could effect in some hundreds. It is this horrid smoake which obscures our churches and makes our palaces look old, which fouls our clothes, and corrupts the waters, so as the very rain and refreshing dews which fall in the several seasons precipitate this impure vapour, which with its black and tenacious quality, spots and contaminates whatever is exposed to it. It is this which scatters and strews about those black and smutty atomes upon all things fowl, and kills our bees and flowers abroad, suffering not our gardens to bud, display themselves or ripen; so a anemonies and many other choycest flowers will by no be made to blow [*sic*] in London, or the precincts of it, they be raised on a hot-bed and governed with extraor artifice to accellerate their springing; imparting a bitter ungrateful tast to those few wretched fruits, which never ing to their desired maturity seem, like the apples of Sod to fall even to dust when they are but touched. Not there to be forgotten is that which was by many observed, that year 1644 when Newcastle was besieged and blocked up late wars, so as through the great dearth and scarcity of co those fumous works many of them were either left off, or but few coales in comparison to what they now use; gardens and orchards, planted even in the very heart of L (as in particular my lord Marquesse of Hertford's in the Str my lord Bridgewater's and some others about Barbican), observed to bear such plentiful and infinite quantities of as they never produced the like either before or since to great astonishment: but it was by the owners rightly to the penury of coales and the little smoake, which they notice to infest them that year; for there is a virtue in the to penetrate, alter, nourish, yea and to multiply plants and without which no vegetable could possibly thrive."

The improvement mentioned by Evelyn, when the use of was for a time less extensive in London, is particularly w of notice, and ought, I think, to be considered as an encou ment to persist in the attempt of rendering London as sm as possible.

CHAR

Jersey, February 25

THE GERMAN CHEMICAL SOCIETY

ON November 11, 1867, a meeting of about e chemists was held in Berlin to take step inaugurating a new Chemical Society. On Januar the succeeding year (1868) the first meeting of the S was held, when Prof. A. W. Hofmann was el president, and the roll-call of the Society contained names. During the first year of its existence 97 pa were read before the Society; at the close of the ye membership had increased to 275, and the Society or that a volume of 282 pages was needed to contain papers communicated to it.

Since 1868 the German Chemical Society has be increased in size and in usefulness; the *Berichte* fo consists of two large volumes numbering, between th 2473 pages, and containing the 563 papers communic to the Society during the year, besides numerous abs of papers published elsewhere. The income of Society for 1880 amounted in round numbers to the s of 2000*l.*, and of this about 1400*l.* was set against the of publishing the *Berichte*.

During the thirteen years of its existence the Ger Chemical Society has published in its *Berichte* mo the important discoveries in pure chemistry made in period. It has been the aim of the Society to pub papers communicated to it with as little delay as poss Meetings are held twice monthly during the session. the papers read at one meeting are published in *Berichte*, which appears on the day on which the meeting takes place. Papers appearing within so shor time after they are communicated are necessarily bre and concise; but this rapid publication confers a gre benefit on all chemists, as they are thus put in possess of at least the leading facts concerning all recent wo almost as soon as these facts have been established the workers. If papers in the *Berichte* are sometime wanting in completeness and symmetry, many of them are full of life and stir, telling as they do of work actual proceeding in the laboratory; appearing sometimes short abrupt snatches, they convey something of the

y the Society; formerly a correspondent in London or aris, &c., sent a general account of chemical work published in the country from which he wrote. The abstracts f the German Society are on the whole shorter than ıose which have for many years made the *Journal* of our wn Chemical Society of such great value to the student; ıey are, however, published at a shorter interval after ıe appearance of the original paper.

Brief accounts are given of recent chemical patents, ıut little space is devoted to purely technical chemistry. s not the *Journal* of the Chemical Society sometimes verburdened by abstracts which might better find a lace in a book professing to collect receipts for the urely "practical man"?

The German Chemical Society in 1877 appointed Dr. . Bischof of Berlin to prepare a general index for the rst ten volumes of the *Berichte*. The arduous task has een admirably fulfilled. Fellows of the Society have now ı their hands not only an index to the *Berichte*, but a olume which is really a general guide to the chemical ork published during the period 1868–1877.

The "Generalregister" extends to 1020 pp.; of these, 62 pp. are devoted to an index of authors, 732 pp. to an ndex of subjects, 42 pp. to an index of patents, and 84 p. to a systematic classification of the carbon compounds eferred to in the index.

Under an author's name are given, not the exact title f his paper, but a very succinct statement of the leading oints in the paper. The same method is pursued in the ubjects-index. Taking, for instance, such a general ubject as "Dissociation," one finds, first, references to ork on the general Theory of Dissociation, *e.g.* connecion between dissociation and temperature, tension, &c.; hen follow special instances of dissociation, inorganic ompounds preceding organic. In the case of individual lements or compounds, the references begin with those apers on the existence of the substance in question, hen follow its preparation and formation, its properties, ts action on other substances, the action of other bodies n it, its estimation, &c., &c.

A systematic nomenclature is adopted, more especially or the carbon compounds: the principles which guided he compiler are stated in a few introductory pages.

The "Generalregister" cannot but be of the greatest value to chemists generally. Almost every chemist is a Fellow of the German Society; many possess the *Berichte* complete up to date; with the *Berichte* and this admirable guide which Dr. Bischof has supplied, they can find almost everything that has been done in experimental chemistry within the period 1868–1877. M. M. P. M.

IRISH ESPARTO GRASS

IT is now over two years ago since attention was called in our pages to the importance of the purple Molinia (*Molinia cærulea*) as a material for making paper. Mr. Christie of Edinburgh sent a small quantity of it to be operated on by Mr. T. Routledge of Sunderland, and the report on this was most favourable. In January, 1879, a notice appeared in the *Times* also calling attention to the subject, and referring to the above favourable report; it expressed the hope that some effort would be used to have this grass collected on an extensive scale. It would seem to be ripe for gathering in the early autumn, when some hands could be spared for such work, and as the ground on which it flourishes—wet or partially drained bogs—pays, at least in Ireland, little if any rent, the crop would cost little over the expense of reaping it. Since the first notice appeared in our columns, the Spanish and African Esparto grass has been getting more difficult to obtain, and the demand for it has been steadily on the increase. It is said that the greater part of what is gathered in Morocco finds its way to the *Times* paper-mills, and its value for paper-making is now known in America. Several analyses of specimens of the dried hay made from this grass are given in a paper by Dr. Cameron, "On the Composition of a Crop of Hay" (*Proc.* Roy. Dub. Soc., n.s., vol. ii. p. 101); we select one of these, which yielded as follows:—

100 parts contained—

Water	27·95
Albuminoids	7·49
Fats	2·70
Non-nitrogenous substances	30·00
Woody fibre	31·26
Mineral water	0·60
	100·00

And of this the ash contained—

Lime	28·86
Magnesia	4·76
Potash and soda	42·17
Phosphoric acid	12·36
Sulphuric acid	5·98
Oxide of iron and alumina	1·00
Chlorine	4·32
Silica	0·55
	100·00

This freedom from silica of the purple Melic grass is very remarkable.

From a paper by Mr. W. Smith in the recent number of the *Proceedings* of the Royal Dublin Society, we learn that a very successful trial has been made in the county of Galway to grow this grass in some quantity. As a native plant it is found in every county in Ireland, both on wet heaths and boggy pastures. It flowers in July and August, and its seeds are ripe early in September; it would seem to grow well on partially drained bogs, and if the surface of these has been burnt, the purple Melic grass grows thereon most luxuriantly. It seems fond of growing in tufts, of somewhat large size, and it does not form a sod like so many other grasses. It would appear that in Ireland alone there are over 1,000,000 acres at the present moment not worth sixpence a year each for any agricultural purpose; each acre would easily grow half a ton weight of dried Melic grass, which at its lowest value would be worth 2*l*. Would not this crop, in time, more than compensate for the loss of the potatoe? It seems a pity that the manufacturer should have to go to the Port of Mogador for what he might get with so much greater ease at the Port of Dublin.

SIBERIAN METEOROLOGY

UP to the present time Yakutsk, in North-east Siberia, has often been cited as the place of our earth where the winter is coldest, while the minima observed during Arctic expeditions are believed to be the lowest known. Neither the one nor the other is true. In Maak's book, "Olekminski Okrug," I find many data which prove that the coldest winter as well as the lowest well-authenticated minima were observed at Werkhojansk, to the north-east of Yakutsk. The name of the author gives us some guarantee that the observations are trustworthy. I give below the minima at some places cited by Maak, and compare them with those observed in Central and Western Siberia, and the Arctic Archipelago of America:—

North-East Siberia

Serdze-Kamen.	67° N.	173° E.	(Nordenskjöld)	– 50·3 F.
Yakutsk	62° N.	130° E.	(Maak)	– 77·3 F.
Wiljuisk	64° N.	122° E.	(Maak)	– 76·3 F.
Werkhojansk	67½° N.	134° E.	(Maak)	– 81·0 F.

Central and West Siberia

Yenisseisk	58½° N.	92° E.		– 73·5 F.
Barnaul	53½° N.	84° E.		– 61·4 F

Arctic Archipelago

British Expeditions, 1875-76.	83½° N. Floeberg Reach (Nares)	− 73·7 F.
	81½° N. Discovery Bay (Nares)	− 70·7 F.

The temperature at Werkhojansk is the lowest of all given here, and it must be borne in mind that the observations lasted but one year, while we have more than thirty-five years at Yakutsk, and eight and a half at Yenisseisk.

The mean temperatures are as follows :—

	Year	July	Nov.	Dec.	Jan.	Feb.	March
Serdæ Kamen 1 yr.	—	—	2·1	− 9·0	−13·1	−13·2	− 6·9
Ustjansk 2 years	2·8	52·7	− 2·2	−33·0	−38·9	−36·9	−17·5
Werkhojansk 1 year	4·3	60·1	−29·2	−46·8	−55·5	−54·5	−29·0
Yakutsk 10 years [1]	12·2	66·5	−20·5	−41·9	−46·8	−37·7	− 0·0
Yakutsk 24 years [2]	12·4	63·3	−19·1	−37·8	−41·4	−30·8	− 8·7
Floeberg Beach 1 yr.	− 3·5	38·3	−16·8	−22·2	−33·0	−38·0	−39·8
Discovery Bay 1 yr.	− 4·2	37·2	−18·4	−24·5	−40·7	−35·0	−37·4

Though the observations were made only during one year at Werkhojansk, it is probable that it would have the coldest winter of all observed till now, as even at Yakutsk, which is the next coldest, January and February were in no single year colder than at Werkhojansk in 1869. From a comparison with the other stations of North-east Siberia it is probable that here in 1869 February was too cold and December too warm.

Now as to the reason why the winter should be colder in North-east Siberia than on the North American Archipelago farther to the north, it is to be found in the extent of the continent, the distance from any sea open in winter, and the prevailing calms. How important is the last reason is best seen by the comparison of the December and January temperatures of the last British expedition. The more northerly Floeberg Beach is warmer, because more exposed to winds. Now in Eastern Siberia calms prevail to a large extent in winter, except near the coast.

There is a phenomenon to be considered, which is noticed everywhere in winter in high latitudes: during calms with clear sky the valleys are colder than the surrounding hills and slopes, because the cold air sinks downwards and stagnates there. This is confined to the night where the mid-day sun rises high enough, but in high latitudes during some months the mid-day heat of the sun is too small and the day too short to interfere much with the equilibrium of the strata of air established during the night. Even in middle latitudes (45°-50°), when calms and clear weather prevail very largely in December, the valleys are regularly colder than the hills. So it was felt in December, 1879, in Central Europe. What is an exception here is the rule in North-East Siberia, because calms and clear sky are the rule in winter; the valleys are much colder than the hills. On this account the exceedingly low temperature of Werkhojansk in winter is probably not common to the whole surrounding country, and especially in the mountains rising to a short distance south we may expect a much higher temperature. The more we consider the conditions of the winter temperature of North-East Siberia, the more difficult it seems to draw isotherms. We know that plains and valleys there are colder than hills and mountain-slopes, but how much, and what conditions are most favourable to that so-called interversion of temperature? I consider it as highly probable that both at Yakutsk and at Werkhojansk the local topographical conditions are very favourable to winter cold. This being the case, it is quite natural that the latter place is colder in winter than the former, being situated 5° farther to the north, and yet far enough from the west to have a continental climate.

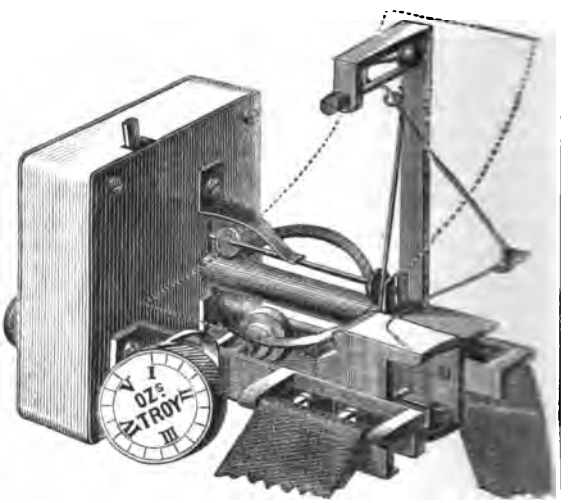
A. WOEIKOF

[1] According to Maak.
[2] Older series of Neverof (1829-54).

SPHYGMOGRAPHY

THE pulse has in all ages been held by physicians to be a valuable aid to the diagnosis of disease, but until the invention of the sphygmograph, or pulse-writer, the determination of the character of the pulse was left to the tutored tact of the doctor's finger, which varies much in delicacy of perception in different operators, and in the same practitioner at different times. At most the finger, even of the most experienced, can only determine regarding the pulse, that it is soft or hard, quick or slow, jerky or languid, regular or irregular; but the finger is incapable of analysing the beats, and detecting any departure from the normal standard of each of the component elements. The sphygmograph, which is quite a modern invention, causes the pulse to write its own autograph, enables us to see at a glance the peculiar characters of the pulse, and to ascertain how and when it differs from the healthy or normal pulse.

Hitherto, however, the sphygmograph has been very little used, for those that have been introduced are large and expensive instruments, requiring a great amount of skill and trouble to fix them on the arm and bring them into action; and for these reasons they are not available for general or private practice. Hence their use has almost been confined to hospital practice; but even here



they are not always available, for Dr. B. Bramwell, who is a strong advocate for employing the sphygmograph, relates that a patient of his was so terrified by the proposal to employ the instrument that he preferred leaving the hospital to allowing it to be fixed on his arm.

The objections to the general use of the sphygmograph do not apply to the instrument recently introduced into medical practice by Dr. Dudgeon, and from its portability called "the pocket sphygmograph." Though this instrument is so small as to deserve the name of "pocket," it is not inferior in sensitiveness to the most elaborate and complicated of the cumbrous instruments hitherto in use, indeed in some respects it is greatly superior in accuracy to any that have yet appeared. Its size is 2½ by 2 inches, its weight only four ounces. It magnifies the movements of the artery exactly fifty times. The spring that presses on the artery can be regulated to press with a weight from one to five ounces, and the pressure can be altered at will while the instrument is *in situ*. It requires no wrist-rest; all the other sphygmographs have to be used with wrist-rests of more or less complexity. It can be used with equal facility whether the patient is standing, sitting, or lying. With it an accurate and extremely distinct tracing of the pulse can be made almost as quickly as the pulse can be felt with the finger.

construction is so simple that if accidentally broken any watchmaker can repair it. The smoked paper on which the pulse is recorded runs through the instrument in ten seconds, so that the number of the beats per minute can be reckoned by multiplying the pulse-tracings on the paper by six. The patient's name, the date, the disease, the pressure of the spring, and some conventional sign to indicate his position when the tracing was made, may be written on the marked paper with any sharp-pointed instrument, such as a pin or a toothpick, and the whole permanently fixed by dipping the paper in some quickly-drying varnish, such as is used by photographers. In this way a series of pulse-tracings taken during the course of the disease may be preserved for future study and comparison.

Dr. Dudgeon's pocket sphygmograph is manufactured by Mr. John Ganter, 19, Crawford Street, W. The wood-cut represents its actual size.

NOTES

WE understand that the fifth volume of the Catalogue of Birds in the British Museum will shortly be published. According to the classification followed in this work the families to be described will be the Thrushes and Warblers, and the volume will be written by Mr. Henry Seebohm, whose co-operation Dr. Günther has been fortunate in obtaining. Mr. Seebohm has devoted a close study of several years to these families of birds, and may now be considered the best living authority on the subject.

M. FLAMMARION, the author of several works in popular astronomy, has been made a Knight of the Légion d'Honneur. Admiral Mouchez, director of the Paris Observatory, has consented to act as his *parrain*, and to hand over to him the star and ribbon. This liberal determination has created some sensation in the French astronomical world. The work of transformation of the Observatory will begin very shortly, all the legal difficulties having been solved. The area of the establishment is now 30,000 square metres. The magnetical instruments will be placed in the deep trenches separating the old ground from the newly annexed buildings.

WE regret to have to announce the death of M. Eugène Cortambert, author of a number of geographical works, honorary president of the Geographical Society of Paris, and head of the geographical department in the National Library.

ABOUT a year ago Admiral Mouchez asked for a credit of 4000 francs per year in order to publish a monthly astronomical review. M. Jules Ferry refused the grant, but a similar review is now being published at Brussels under the name *Ciel et Terre*. It appears twice a month, and is devoted to meteorology and astronomy.

ALTHOUGH our Government has declared the interest which it takes in the forthcoming International Exhibition of Electricity at Paris, still it sees no necessity for appointing a Special Commissioner to take measures with regard to the participation of British subjects in the Exhibition which is to open in Paris on August 1 next in the Champs Elysées Palace. The French Government is nevertheless disposed to welcome all British subjects wishing to participate in the Exhibition. M. Berger, the Commissaire-Général, has placed himself unreservedly at the disposal of intending exhibitors to afford every information and assistance. He would be thankful if they would fill up and return to his address the printed form of demand of admission which accompanies the copy of the general regulations. English exhibitors will be placed in every respect on the same footing as French exhibitors. M. Berger will form a special section for the group of English exhibitors, and requests that all demands be forwarded within the briefest delay possible. The Exhibition rooms and dependencies will be considered as real Custom-house stores, so that all the articles sent there shall be exempt from the duties to which they would otherwise have been liable. The French railway companies have consented to an abatement of 50 per cent. on the ordinary rates of transport, whether by fast or by slow trains, for all packages or boxes forwarded to the Exhibition Hall, and bearing the official labels. The Postmaster-General has been authorised by the British Government to exhibit in the name of the latter.

A COMMITTEE has been formed at Dijon for erecting a statue to Carnot, the celebrated French geometer and politician, who was born in Nolay, a small country town of Burgundy, in 1753. The youngest son of Carnot is now living, one of the members of Senate, and his grandson is M. Sadi Carnot, the present Minister of Public Works. The other son of Carnot died fifty years ago, after having written a small essay, "Sur la Puissance motive du feu." M. Carnot's brother has just published a new edition of this work, with a number of essays, mostly unpublished, by the same author, and a history of his life.

AT the conclusion of the proceedings of the Quekett Microscopical Club on February 25 occasion was taken to present to Mr. J. E. Ingpen a memorial of the esteem in which he is held and the appreciation of his services as honorary secretary for the last eight years. After an able address by Dr. Matthews, setting forth the reasons which had led to this movement on the part of the members, and short speeches by Dr. Cobbold, Mr. Crisp, and Mr. Michael, Mr. T. C. White handed to Mr. Ingpen a beautifully illuminated and framed memorial, together with a valuable microscope by Zeiss and a handsome silver tea-service, which were accepted and acknowledged amidst hearty demonstrations of good feeling on the part of the meeting. The attendance of members was unusually large, and in the course of the evening telegrams were received from Dr. M. C. Cooke and Mr. Henry Lee, expressing their regret at unavoidable absence.

AT the ordinary meeting of the Meteorological Society, to be held at 25 Great George Street, Westminster, on Wednesday, the 16th inst., at 7 p.m., there will be an exhibition of instruments, consisting of various kinds of hygrometers and of such new instruments as have been brought out since January 1, 1880. During the evening the President will give a historical sketch of the different classes of hygrometers, and will also describe such forms as are exhibited.

THE town of Casamicciola, in the Island of Ischia, has been almost entirely destroyed by an earthquake. More than 200 houses have been thrown down, and many others are so much damaged as to be uninhabitable. The number of persons thus far ascertained to have been killed is 104, and very many more have been injured. The total number of victims is estimated at 300. This dreadful catastrophe was the result of two shocks—the first at half-past one in the afternoon of the 4th inst., lasting seven seconds; the second after an interval of an hour and a half. The whole upper part of the town has been destroyed. The handsome Albergo della Grande Sentinella is a mass of ruins. Clefts and fissures opened in the streets 50 centimetres in width. It was at first supposed that this disaster was connected with the partial eruption of Vesuvius on the 3rd inst., but Prof. Palmieri has stated that the seismographic instruments having given no indications, he is inclined to think the catastrophe is due to some local phenomenon, possibly to a sudden sinking of the ground through subterranean corrosion caused by the continual working of the mineral waters. Shortly before the first shock of earthquake the mineral springs were observed to be in a state of ebullition. Another shock was felt at midnight.

SHOCKS of earthquake occurred at St. Ivan-Zelina (Hungary) on February 26 at 3h. 54m., in the night of February 26-27 at

12h. 30m., and on February 27 at 5h. 28m. a.m. At Agram a rather severe shock was felt on February 25 at 3h. 45m., duration two seconds, direction west-south-west; and another at noon of March 4. Earthquakes are also reported from Kirchberg (Austria), on February 28, at 2h. 20m. a.m., duration two seconds, and from different parts of Switzerland on March 3, *e.g.* Zürich and its environs, at 3h. 35m. a.m.; Aussersiehl, at 3h. 42m., direction west to east, duration two seconds; Riesbach, Selnau, Knonau, Aaran, Zofingen, Hunzenschwyl, Rapperschwyl, Glarus, Zug, Berne. The earthquake shock felt at Berne on Thursday morning last shortly after three o'clock was a very smart one. The area of disturbance was wide, extending as far as the Lakes of Geneva and Bienne.

MR. H. J. JOHNSON-LAVIS writes to us from Naples, under date March 2:—Vesuvius has to-day been covered with snow, and this evening, during a short interval between the mantling of clouds, a splendid stream of lava is pouring down the northern side and has reached the Atrio del Cavallo. The stream is very liquid and very abundant, and from this it may be concluded that its course will be progressive.

M. JULES FERRY has established a number of colleges for females in several parts of France; some of them have been already opened.

THE authorities of the British Museum will very soon issue their scheme for publishing the great catalogue of printed books. The projected issue, at the rate of five volumes a year, is not expected to be completed in less than forty years. The work, however, can of course proceed no faster than the Government grant of 1600*l.* a year for this special purpose will permit. Altogether the catalogue is likely to comprise about 3,000,000 titles, which to put in type will cost from 4*d.* to 6*d.* each. It has already been announced that the publication will commence with volumes specially devoted to certain subjects, or rather sub-headings, which have now become too voluminous for convenient handling in their present form. Meanwhile the Trustees have adopted the plan of printing and publishing the titles of all additions to the library. It may be interesting to know that in this case all titles are stereotyped on separate "plaques," and are therefore susceptible of any amount of re-arrangement.

AN important experiment in electric lighting is about to be made in the City. Hitherto the electric light has been used, as on the Thames Embankment and Waterloo Bridge, in conjunction with gas; but in the City the thoroughfares selected are to be lighted by electricity alone, which will be continued all night. The first district begins with Blackfriars Bridge, and extends along Bridge Street, Ludgate Hill, the north side of St. Paul's Churchyard, and down Cheapside as far as King Street. The distance is 1648 yards, and is to be lighted by the Brush system. At King Street the Siemens system will begin, and will extend along the rest of Cheapside, the Poultry, Mansion House Street, King William Street, and Adelaide Place, and across London Bridge. The same system will be extended down King Street, Queen Street, and Mansion House Street. The whole length of street covered by the Siemens light will be 1521 yards. Another district to the south of these will be lighted by the Jablochkoff lamps, like the Embankment. It will include Southwark Bridge, Queen Victoria Street, Queen Street Place, and part of Queen Street, a distance of 1703 yards. The experiment is to be continued for a year, at an outlay of about 8000*l.*

PROF. BLACKIE being unable to lecture through illness, Mr. Shelford Bidwell, M.A., LL.B., will give a discourse on Selenium and its Applications to the Photophone and Telephotography, at the Royal Institution, on Friday evening next March 11), at 9 p.m.

THE Calendar of the Mason Science College, Birmingham, is a volume of respectable size, but then it contains a full report of proceedings and addresses at the opening meeting. We are glad to see that a large number of new chairs are about to be added, including Greek, Latin, and modern languages; so that the College will shortly be as well equipped as that at Manchester. As the curriculum is being extended to include only literature, science, and art, might it not be well to drop the "science" from its designation? it looks so one-sided.

THE *Proceedings* of the last Congress of Russian Naturalists, which was held at St. Petersburg, have just appeared as a separate bulky volume.

A PAPER has been published by Gustav Hauser of Erlangen on the organs of smell in insects, in which he describes several experiments. Numerous species of insects, on approaching vessels containing turpentine or acetic acid, showed—by raising and moving their antennæ—a distinct perception of the smell. After the ends of the antennæ had been cut off, the same insects placed close to the vessels appeared quite insensible to it. A number of flies, which had been attracted by a piece of putrid meat, showed no inclination to approach it after the third segment of the antennæ had been cut off.

WE have received a pleasant report of the Queenwood College Mutual Improvement Society for the year ending Christmas 1880. The Society seems to have a comprehensive programme.

UNDER the title of the *Northern Microscopist*, and under the editorship of George E. Davis, a monthly periodical has been started, beginning with January of this year, the chief aim of which is to keep a record of the proceedings of the chief microscopical societies in the North of England, and thereby to furnish each individual member of these societies with as much permanent information as such members would obtain if the society to which they belonged published its own Transactions. There ought to be abundant support for a little journal like this, and numerous subscribers ought to be obtained from large centres like Liverpool, Leeds, Chester, Bolton, Manchester, Nottingham, Newcastle-on-Tyne, and the like. If the various Northern societies were to do nothing more than prepare local lists of all the varied species of animal and vegetable life, which come under the well-known denomination of "microscopical forms," and if this journal were to be the medium of publishing these, it would become a journal of importance, one that would be constantly referred to; and it would in the meantime be doing a good work in advancing the study of the biological sciences. We wish it every success, and trust that it will steadily pursue the path that it has marked out for itself.

A STENOGRAPHIC piano has been experimented on by the daughter of the inventor, in the French Chamber of Deputies, the Senate, and to the Municipal Council of Paris, with great success. The system consists of a combination of signs through which every sound is represented. The reproduction is as rapid as speaking, and the same operator can continue the work for hours. The signs used in this system being printed by machinery, the reading is immediate, and can be made by other people than the operator. The State stenographers propose to be trained in the use of the instrument. It is an affair of a few months' practice.

A SCIENTIFIC society has been formed at Scarborough, called "Scarborough Scientific Society and Field Naturalists' Club." President-elect, Mr. J. Woodall, M.A.; Secretary, Mr. G. Massee.

THE excavations in the 9th region of Pompeii are being prosecuted with alacrity, and yield unexpected results. Besides a second mosaic fountain and valuable frescoes recently found,

there were excavated the other day some vases of Egyptian manufacture, which will greatly interest archæologists. They are made of a particular kind of paste, composed of white clay and glass, and are extremely brittle. All round they have high relief representations of the animals worshipped by the ancient Egyptians.

A PHONOGRAPH of a new construction will be tried in the New Polyglot Institute of Paris, for the purpose of teaching pupils the art of pronouncing correctly the difficult words of foreign languages.

A SCHOOL for clockmakers has been organised in Paris, and was inaugurated yesterday by a meeting at the Conservatoire des Arts et Métiers.

THE new part of the *Transactions* of the Asiatic Society of Japan contains a paper by Dr. Edkins on the influence of Chinese dialects on the Japanese pronunciation of the Chinese part of the Japanese language.

WE have received part 3 of the *Transactions* of the Epping Forest Club, containing the address of the president, Mr. Meldola, proceedings, and list of members.

WE have to acknowledge the receipt of a postal order for 2*s*. 6*d*. from "Bullphumpus" for the John Duncan Fund.

THE additions to the Zoological Society's Gardens during the past week include an Indian Leopard (*Felis pardus*) from India, presented by the Duke of Buckingham and Chandos; an Entellus Monkey (*Semnopithecus entellus*) from India, a Greater Sulphur-crested Cockatoo (*Cacatua galerita*) from Australia, a Blue-fronted Amazon (*Chrysotis festiva*) from Brazil, deposited; four Indian Rat Snakes (*Ptyas mucosa*) from India, a Matamata Terrapin (*Chelys matamata*) from Upper Amazons, purchased; two Calandra Larks (*Melanocorypha calandra*), European, a Chinese Quail (*Coturnix chinensis*) from China, two Fire-tailed Finches (*Erythrura prasina*) from Java, received from Paris.

OUR ASTRONOMICAL COLUMN

THE SOLAR PARALLAX.—M. Faye has just communicated to the Academy of Sciences a paper on the actual state of our knowledge of the sun's parallax, of which we subjoin some particulars, without professing to regard his mean result as necessarily so definitive as he appears to view it himself.

M. Faye considers that there is no other scientific constant, the determination of which depends on an equal number of results completely independent of one another, and obtained by methods so totally different, and subdivides the various values assigned for the sun's mean parallax as follows:—

Geometrical methods, 8″·82	8″·85 by Mars (Cassini's method)	Newcomb.
	8·79 by Venus, 1769 (Halley's method)	Powalky.
	8·81 by Venus, 1874 ,, ,,	Tupman.
	8·87 by Flora (Galle's method)	Galle.
	8·79 by Juno ,, ,,	Lindsay.
Mechanical methods, 8″·83	8·81 by the lunar inequality (Laplace's method)	—
	8·85 by the monthly equation of the earth	Leverrier.
	8·83 by the perturbations of Venus and Mars	Leverrier.
Physical methods, 8″·81	8·799 Velocity of light (Fizeau's method)	Cornu.
	8·813 Velocity of light (Foucault's method)	Michelson.

With regard to the first value by "mechanical methods," M. Faye mentions that he has obtained it by adopting for the coefficient of the inequality 125″·2, the mean between the results of Sir George Airy from the Greenwich observations, and that of Prof. Newcomb, from the observations made at Washington, taking for the moon's mean parallax, 57′ 2″·7, and for her mass $\frac{1}{80{\cdot}8}$. Leverrier found the value 8″·95 from the said equation, which was reduced after correction by Mr. Stone for two small errors to 8″·85. The value from the perturbations of Venus and Mars assigned by Leverrier was 8″·86, but one of the numbers requiring a small correction, it is reduced to 8″·83. Michelson, after bringing to bear upon Foucault's method improvements which M. Faye says completely surmounted all difficulties, found for the velocity of light 299940 km., while Helmert altered Cornu's result to 299990 km. With Struve's constant of aberration the corresponding values for the solar parallax are 8″·799 and 8″·813, as above.

The general mean in which it may be considered that the errors of the individual results, obtained by so many methods, are to a great extent compensated is 8″·82, and to this value M. Faye, for reasons given, attributes a probable error of ± 0″·016. The mean value by the physical methods is 8″·806, and by astronomical methods 8″·825. He then considers which of these values is the more reliable, and states that he does not hesitate in giving the preference to the physical result, and arrives at the conclusions:—

1. That the method of the physicists is superior to all others, and ought to be substituted.

2. That the value of solar parallax, 8″·813 (by physical methods), is now determined to about $\frac{1}{10}$ of a second.

3. That the seven astronomical methods of procedure converge more and more towards that value, and tend to confirm it without equalling it in precision.

M. Faye adds that he has no idea of attempting to diminish the importance of the observation of the approaching transit of Venus: but as Leverrier pointed out, "il faut que les efforts des astronomes aient pour but d'obtenir une précision toute nouvelle dans leur prochaines expéditions." Without neglecting the contacts, he considers it will be desirable to employ to a greater extent than was done in 1874 "les procédés si puissants de la photographie," to which, be it observed, M. Faye from his own experiences drew attention a quarter of a century back. He thinks it will be very surprising if that admirable method of procedure, which has already succeeded so well in measuring delicate stellar groups, should fail for the transit of Venus, or under circumstances more favourable for its application. The value 8″·813 for the sun's parallax, which appears to him definitive, is in accordance with that adopted by Laplace in the *Mécanique céleste*, 27·2 centesimal seconds or 8″·812.

SWIFT'S COMET, 1880 *e*.—Mr. Winslow Upton of the Naval Observatory at Washington, sends us elements of this comet, which, as he remarks, afford a further confirmation of the 5½-years' period already assumed. He employed two observations made with the meridian circle of the Washington Observatory on October 25 and November 23, and one with the 26-inch equatorial on December 22. The elements are as follow:—

Epoch 1880, October 25·5 M.T. at Washington.

Mean anomaly	357	48	49″·3		
Perihelion from node	106	18	13·8	M. Eq. 1880·0	
Ascending node	296	41	55·4		
Inclination	5	31	3·5		
Angle of eccentricity	42	31	39·7		
Log. semi-axis major	0·518438				

The corresponding period is 2189 days, or a little less than six years. The middle place is represented within the small errors of − 1″·2 in longitude and − 0″·6 in latitude.

PHYSICAL NOTES

MR. T. C. MENDENHALL of Japan has measured with a so-called "invariable pendulum" the acceleration of gravity at the top of the extinct volcano Fujiyama, which plays so prominent a part in the mythology and in the art of Japan. The value found for the summit of the mountain was g = 9·7886, whereas at Tôkio the value was found to be 9·7984. The average barometric pressure at the summit was 19·5 inches, the mountain itself being an almost perfectly symmetrical cone of vertical angle 138°, and of a height of 2·35 miles. It rises alone out of a plain of considerable extent, and appears to be composed of a uniform rock of porous nature. Tradition states that the mountain was thrown up in a single night in the year B.C. 286. The density of the rock in the lump was 1·75, but when reduced to powder the density was 2·5; competent geologists conclude the mean density of the mountain mass to be 2·12. Assuming the mountain to be a cone of semi-vertical angle of 69°, and density 2·12, Mr. Mendenhall calculated its attraction upon a particle

placed at the vertex, and comparing it with his result, deduced for the mean density of the earth the value $D = 5{\cdot}77$. If however the accepted density of the earth as determined by Bailly at 5·67 be adopted, it follows that the mean density of Fujiyama is only 2·08.

A CAPITAL summary of the recent thermochemical investigations of Julius Thomsen appears in the current number of the *Am. Journ. Sci.* from the pen of Prof. Josiah P. Cooke (of Cambridge, Mass.). The peculiar significance of these researches in their bearing upon the problems of molecular structure in general and upon the supposed ring-structure of the benzene molecule in particular, is pointed out in a clear and emphatic manner.

M. ROSENSTIEHL has freshly determined the tints corresponding to the three primary colour-sensations, on the principle of rotating disks originally devised by Clerk-Maxwell. Constructing a disk with seventy-two sectors of gradating tints of as nearly equal saturation as could be judged of by the eye, he found that a sensation of red more powerful than any single red tint could be compounded from blue, violet, red, orange, and orange-yellow, with a maximum intensity in the orange. Similarly a sensation of green more powerful than the brightest green tint, could be compounded out of a set of tints having a greenish-yellow for their maximum point, and the sensation of blue culminated in a tint named "third blue" by M. Rosenstiehl. Hence M. Rosenstiehl proposes to accept as the primary-sensation tints of the Young-Helmholtz theory the orange, the yellow green, and the ("third") blue tints, in which the three sensations of red, green, and blue find their respective maxima; further arguments on this point are promised shortly by M. Rosenstiehl.

ACCORDING to Wiedemann Swedish filter-paper, pyroxylised by steeping in mixed strong nitric and sulphuric acids, forms an excellent source for electricity by friction. Prof. Guthrie's films of collodion and gutta-percha, in five or six alternate layers, realise the same end, namely that of utilising for the generation of electricity the most powerfully *negative* electric known pyroxylin.

DURING a hailstorm in Geneva on January 19 Prof. Colladon observed the hailstones as they fell to repel each other mutually and to bound about after lying quiet for a moment or two on the ground exactly after the fashion of the pith balls in Newton's well-known experiment of the *electric hail*. The observation would appear to have a bearing on Volta's somewhat neglected theory of the formation of hail.

COMMANDER O. J. SHERMAN has taken some observations of deep-sea temperatures during the summer of 1880 on the Arctic steamer *Gulnare*, when becalmed at about lat. 61° N., long. 56° W., at a point where a branch of the warm Gulf Stream current is represented on the maps as being overlapped by an Arctic current whose direction is to the eastward coast of Greenland. The temperatures at the surface being in two observations respectively 41°·9 (F.) and 45°·0, those at the depth of sixty fathoms were found to be 39°·0 and 40°·0 respectively. At 150 fathoms a temperature of 38°·2 was observed, but at lower depths the temperature was again higher, reaching 40°·8 at 300 fathoms.

M. PAUL SÉGUY, whose experience as a constructor of vacuum-tubes is very great, gives the following results of observation upon the effect of cold upon the discharge through exhausted tubes. A tube cooled (naturally by being placed in a cold room) exhibits increased resistance, sometimes double its usual resistance, and may even require to be warmed at the fire or over a spirit-lamp to bring it to its usual working condition. But then the tube does not at once recover itself, but only gradually as the passage of the spark liberates heat and warms the glass and the electrodes. This experiment is best shown with a long thin tube and with a feeble induction-coil. With Crookes's high-vacua tubes the effects of heat are more pronounced, and can be readily observed by arranging a discharger in a branch circuit, the spark leaping between the poles of the discharger when the air-resistance is less than that of the tube. A cooled Crookes's tube does not transmit a spark equivalent to a 3-centimetre spark in air; but when warmed, the "radiant" effects appear to give place in turn to ordinary stratified discharges as the temperature rises. The inverse order of phenomena should take place on cooling, but does not if care has not been taken in the construction of the tube to expel residual occluded gases from the aluminium electrodes by heating them during the exhaustion. The effects of extreme artificial cold upon vacuum-tubes was not tried by M. Séguy. In conclusion M. Séguy asserts the existence of a curious phenomenon, namely, that in a tube used frequently and for a long time, the vacuum may grow more perfect, so as at last to be almost absolute. M. Séguy attributes this effect to the gradual occlusion by the electrodes of the residual gases.

IT has been proved by Herren Stroubal and Barus (*Wied. Ann.*, No. 13, 1880), from experiments in which steel wire was treated so as to show all degrees of hardness between the glass-hard and annealed states, that the thermo-electric and galvanic properties of steel vary with the degree of hardness in a very sensitive manner. Their researches throw some useful light on the nature of the annealing process and on the magnetic behaviour of steel in relation to its hardness and other properties.

HERR HOLTZ has been able (*Wied. Ann.*, i. 1881) to measure the modulus of elasticity of rods of carbon used for the electric light (Carré's, of Paris) by the acoustical method: the rod being held in the middle with two fingers, and stroked lengthwise with two other fingers on which colophonium has been rubbed. The modulus increases with the density, which is, as a rule, greater in the thinner rods. The tone of thin rods alters a good deal, on repeated rubbing, through heat being generated. On an average the modulus is equal to that of lead. As to the improved increase of electric conductivity of carbon rods with rise of temperature, Siemens has tried to account for it by supposing allotropic modification (as is probably the case with selenium). Herr Holtz, however, shows that pyrolusite, a metallic oxide, behaves similarly, but such an explanation would not here apply. Nor does pyrolusite conduct as an electrolyte; there is no polarisation. For carbon Herr Holtz adheres to his hypothesis (of closer pressure of molecules caused by heat, improving the conduction), in default of a better.

A CENTIGRADE photometer devised by S. Coglievina is described in the *Rivista Sci. Ind.* for January 31. He seeks to remedy the imperfections of ordinary methods by substituting for a single source of light, defined by the substance of the candle, bustible or its hourly consumption, a flame of variable size, which can be reduced to a particular degree of illuminating force. He means to apply the same principle to the electric and other light sources.

AN interesting phenomenon of polarisation of light was observed by Herr Sörrensen in the recent cold weather (*Nature*, No. 9). Some of the ice on a window-pane had melted, the water forming a small pool at the bottom. In this pool various bright and beautiful colours appeared; on looking closer they were seen to be only in the grotesque images of frost flowers as the lower part of the window, reflected in the water. The reflecting water surface was here the analyser, while the thin ice crystals, varying according to position and thickness in the ice flowers, played the part of polychromatic gypsum and mica plates. To find the polariser Herr Sörrensen took a Nicol prism, and observed that the daylight itself was strongly polarised; and this he accounts for by the presence of a light mist of ice particles reflecting the sunlight. The temperature outside was about − 12°.

WITH reference to the physical conditions of heavenly bodies Herr Lohse (*Wied. Ann.* 1) has experimentally studied the phenomena of glow on various metallic electrodes (magnesium, zinc, iron, cadmium, copper, &c.) in a hydrogen atmosphere of varying pressure. Quantitative data as to the relation of vapour formation to the density of the gas are furnished; and it is proved, *inter alia*, that with progressive rarefaction of hydrogen the luminous power of metallic vapours in the more refrangible parts of the spectrum increases (a sign of exalted temperature).

M. PELLAT gives, in the *Journal de Physique* (February), results of an inquiry into the apparent difference of potential of two metals in contact. This difference he finds to depend essentially on the nature of their superficial layer, and to vary (sometimes considerably) with chemical or simply physical changes of the surface. When an inert gas surrounding the metals is rarefied, the apparent difference of potential increases, and it recovers its former value on the pressure being restored. Further, the said difference has the same value as the electromotive force of a battery element formed by alcohol and the same metals (not yet altered).

DR. PULUJ has made the following experiment to prove his suggestion that radiant matter consists of electrode particles

pulled off by the action of electricity. The cathode of a vacuum-tube was covered with chalk. It exhibits phosphorescence of orange-yellow colour, while in a short time the tube-wall becomes covered by a very delicate layer of chalk, without losing its clearness and transparency, and phosphoresces like chalk. Puluj believes that the yellow-coloured phosphorescence observed on metallic cathodes is caused by the phosphorescence of the oxides covering the metal.

GEOGRAPHICAL NOTES

AT its annual meeting the Russian Geographical Society elected as vice-president M. Semenoff, and Baron Osten-Secken as his "aid." The great Constantine medals were awarded to M. Moushketoff, for his geological researches in Central Asia, and to M. Yanson, for his remarkable work on "Comparative Statistics of Russia," the two first volumes of which have already appeared; the Lütke gold medal was awarded to Baron Kaulbars for his papers on the Lowlands of the Amu-daria; the two great gold medals instituted last year for ethnographical and statistical researches were awarded to Dr. Pyasetzky for his work, "Travels to China during the Years 1875-77," and to M. Roussoff for his statistical description of the Nyejin district. Small gold medals were awarded to M. Nordkvist, who took part in Nordenskjöld's expedition; to M. Potanin for his travels in Mongolia; to M. Tyaghin, for meteorological observations on Novaya Zemlya, and to M. Mainoff for anthropological explorations among the Mordovians. Silver medals were awarded to Mme. Treskina and to MM. Andrianoff, Unterberger, Polonsky, Orloff, Skassi, Karatin, Zinovieff, Krasovsky, and Mikhalenko.

WE learn from the last number of the *Isvestia* of the Russian Geographical Society that the Society sends this spring M. Polyakoff with an assistant for the exploration of Sakhalin Island. M. Polyakoff will start from Odessa, on board of a Russian ship, and proceed to Sakhalin, where he will stay during a year; thence he will go to the Mantchurian shore of the Pacific for further explorations.

THE explorer Begaert has arrived at Lisbon. He was sent by the King of the Belgians to make scientific researches on the route of Mr. Stanley at Vivi and other parts of Zaire.

WE are glad to learn that the U.S. Congress have decided to appropriate 175,000 dollars to send out an expedition in a whaling vessel in search of the missing steamer *Jeannette*, which was sent out in 1879 by Mr. Gordon-Bennett to carry on Arctic exploration by way of Behring Strait. The initiative in this matter is due to Chief-Justice Daly, President of the American Geographical Society.

IN addition to two papers descriptive of the visits of Mr. Leigh Smith to Franz-Josef Land and Mr. Delmar Morgan to Kuldja, the new number of the Geographical Society's *Proceedings* gives Mr. F. C. Selous' notes on some of his many journeys in South Central Africa, those dealt with here being to the north of the Zambesi between the 27th and 29th meridians, and in the neighbourhood of the River Chobe which empties into the great river above the Victoria Falls. We gave last week the text of the interesting note on Col. Prejevalsky, in addition to which we may refer to the record of some altitudes recently determined in Matabele Land, and a note of Dr. Otto Finsch's explorations in Polynesia. The maps this month are of the South Coast of Franz-Josef Land and the Central Zambesi region.

WE observe that M. Henri Duveyrier's interesting observations on the question of the sources of the Niger appear in the last (December) number of the French Geographical Society's *Bulletin*, but we regret to find that they are published without a map.

IN last week's issue of *Les Missions Catholiques* Mgr. Lavigerie, Archbishop of Algiers, commences an account of the missions of Equatorial Africa, with the direction of which he has been charged. There is also a letter from Père Antonin de Reschio in Brazil, in which will be found some notes on curious traditions among the Indians.

MARQUIS ANTINORI and the other members of the Italian expedition to Shoa are expected shortly at Zeila. It is also stated that Signor Libman, an Italian traveller, has gone to Assab in order to make an attempt to open commercial relations with the interior and to survey some of the little-known regions in the neighbourhood. Signor Giuletti, who accompanied the Italian official representative to Assab in January, is charged by the Italian Geographical Society to undertake a journey through the country of the Danakil and Adel tribes, and to study the best means for opening a trade-route between Assab and Abyssinia. His mission has considerable geographical importance, as the region to be traversed is unknown, and he will have an opportunity of solving the problem of the River Gualima, which probably he found to empty into some lake in the interior, as the Hanash does, if indeed it be not part of the latter river-system.

CAPT. NEVES FERREIRA, Governor of Benguela, and other Portuguese officers, have placed their services at the disposal of the Lisbon Geographical Society for a scientific expedition across Africa, to start from the West Coast.

THE *Sydney Morning Herald* of January 17 publishes a telegram from their Queensland correspondent as follows, dated January 14:—"Skuthorpe arrived two days ago from his exploring trip out west. He reports having travelled 200 miles inside the South Australian boundary, and in the Herbert River discovered relics of Leichhardt, consisting of his diary and Classen's diary; also a telescope with presentation engraving, compasses, and other things. These, he alleges, are in two packs which he has brought with him. The diary of Classen is to the effect that he left Leichhardt at the Saltwater Creek while he searched for water, and that on his returning he found the party dead, and then joined the blacks, with whom he lived until three years ago. Skuthorpe will not allow any one to inspect the alleged relics, and here it is considered doubtful whether they are genuine."

INTELLIGENCE has been received at the Foreign Office from Her Majesty's Consul at Mozambique, which confirms the report of the deaths of Capt. Phipson-Wybrants and Messrs. Carr and Mears, of the Wybrants' expedition. Mr. Mayes is stated to be at Umzeilas, and Mr. Owen to have left with the remainder for Inhambane, whither Her Majesty's ship *Ruby* will proceed forthwith.

ON THE VISCOSITY OF GASES AT HIGH EXHAUSTIONS[1]

II.

INFLUENCE of Aqueous Vapour on the Viscosity of Air.—In the foregoing experiments many discrepancies were traced to the presence of moisture in the gas. The influence of aqueous vapour does not appear to be great when present in moderate amount in gas of normal density, but at high exhaustions it introduces errors which interfere with the uniformity of the results. A series of experiments were accordingly undertaken to trace the special action of aqueous vapour when mixed with air.

Up to a pressure of about 350 millims. the presence of aqueous vapour has little or no influence on the viscosity of air. The two curves are in fact superimposed. At this point, however, divergence commences, and the curve rapidly bends over, the viscosity falling from 0·0903 to 0·0500 between 50 and 7 millims. pressure. Here it joins the hydrogen curve, and between 7 millims. and 1 millim. they appear to be identical.

These results are partly to be explained by the peculiar action of water vapour in the apparatus. At the normal pressure the amount of aqueous vapour present in the air, supposing it to be saturated, is only about thirteen parts in a million, and the identity of the log dec. with that of dry air shows that this small quantity of water has no appreciable action on the viscosity. When the pump is set to work the air is gradually removed, whilst the aqueous vapour is kept supplied from the reservoir of liquid. As the exhaustion approaches the tension of aqueous vapour, evaporation goes on at a greater rate, and the vapour displaces the air with increasing rapidity; until, after the pressure of 12·7 millims. is passed, the aqueous vapour acts as a gas, and, being constantly supplied from the reservoir of water (as long as it lasts), washes out all the air from the apparatus, the log dec. rapidly sinking to that of pure water gas.

This explanation requires that the viscosity of pure aqueous vapour should be the same as that of hydrogen, at all events between 7 millims. and 1 millim. pressure. The facts can, however, be explained in another way. During the action of the Sprengel pump sufficient electricity is sometimes generated to render the fall tubes luminous in the dark. It is conceivable

[1] Abstract of a paper read before the Royal Society, February 17, 1881. by William Crookes, F.R.S. Continued from p. 423.

that under such electrical influence the falling mercury may be able to decompose aqueous vapour at these high exhaustions, with formation of oxide of mercury and liberation of hydrogen. Of these two theories the latter appears to be the more probable.

The presence of water vapour shows itself likewise in the very slight amount of repulsion produced by radiation. Repulsion commences in air at a pressure of 12 millims., whilst at a higher exhaustion the maximum effect rises to over 40 divisions. Here, however, repulsion does not begin till the exhaustion is higher than the barometer gauge will indicate, whilst the maximum action after long-continued pumping is only 9 divisions.

Viscosity of Kerosoline Vapour.—The rapid diminution of viscosity in the last experiment after reaching the pressure of 400 millims., is probably due to the aqueous vapour in the air being near its liquefying point. It was thought advisable to test this hypothesis by employing a somewhat less easily condensible vapour, which could be introduced into the apparatus without any admixture of air. An experiment was accordingly tried with a very volatile hydrocarbon, commercially known as Kerosoline, boiling at a little above the ordinary temperature. The vapour of this body was introduced into the well-exhausted apparatus, when the gauge at once sank 82·5 millims. After the usual precautions to eliminate air a series of observations were taken.

The loss of viscosity is more rapid than with any other gas examined except aqueous vapour. Conversely a very great increase of viscosity occurs on increasing the pressure from 8 to 82·5 millims. The explanation of this is that the vapour of kerosoline is very near its liquefying point, and therefore very far from the state of a "perfect" gas.

The negative bend in the curve at about 10 millims. pressure, already noticed with other gases, is strongly marked with this hydrocarbon vapour.

Discussion of Results.—When discussing the viscosity results obtained with the different gases experimented with, the author gives the following approximate comparison of viscosities, such as is afforded by a comparison of the log decs. of each gas and that of air, comparing the ratio with that obtained by Graham, Kundt and Warburg, and Maxwell.

	Graham	Kundt & Warburg.	Maxwell.	Crookes.
Air	1·0000	1·0000	1·0000	1·0000
Oxygen	1·1099	—	—	1·1185
Nitrogen	0·971	—	—	0·9715
Carbonic oxide... ...	0·971	—	—	0·9715
Carbonic anhydride ..	0·807	0·806	0·859	0·9201
Hydrogen	0·4855	0·488	0·5156	0·4439

Graham's numbers are the theoretical results deduced from his experiments on transpiration of gases. They are, he says,[1] the numbers to which the transpiration times of the gases approximate, and in which they have their limit. Graham concludes that the "times of oxygen, nitrogen, carbonic oxide, and air are directly as their densities, or equal *weights* of these gases pass in equal times. Hydrogen passes in half the time of nitrogen, or twice as rapidly for equal volumes. The result for carbonic acid appears at first anomalous. It is that the transpiration time of this gas is inversely proportional to its density when compared with oxygen."

The proportion between air and oxygen, nitrogen, or carbonic oxide is not very different at any degree of exhaustion to that which it is at 760 millims. Carbonic anhydride, however, is different; the proportion between it and air holds good between 760 and 650 millims. Then it gets lower and lower as the pressure sinks, until 50 or 55 millims is reached, when the proportion between it and air again becomes constant.

Hydrogen, however, is entirely different to the other gases; its log dec. remains the same to a very high exhaustion, and, that of other gases sinking, it is evident that the proportion between this gas and any other is different for each pressure.

It must not be forgotten that the pressure of 760 millims. is not one of the constants of Nature, but is a purely arbitrary one, selected for our own convenience when working near the level of the sea. In the diagrams accompanying his R.S. paper the author has started from this pressure of 760 millims., and has given the log dec. curves which approximately represent the viscosities through a wide range of exhaustion. But the curves might also be continued, working downwards instead of upwards. From

in which they have been kept for eighteen years
altered their direction, and on dissecting a porti
component fibres remain distorted and bent, e
resume their original shape.

Were glass perfectly elastic the log dec in a
would probably be equal to *zero*: there would th
nution in the arc of vibration, and the torsio
swinging would go on for ever.

The Ultra-Gaseous State of Matter.—A com
curves of viscosity of the gases, especially hydr

given in the foregoing pages, confirms the supposition that a gas, as the exhaustions become extreme, gradually loses its gaseous characteristics, and passes to what the author has ventured to call an ultra-gaseous state. Certainly it ceases to possess many of the properties usually held to be the essential attributes of gaseity.

For instance, Maxwell's law that the viscosity of a gas is independent of pressure holds good to a certain point, and then it rapidly breaks down. All gases appear to obey Maxwell's law between some limits of exhaustion, and diverge from it at others. Thus the nearly perfect gas hydrogen shows signs of increasing in viscosity as the pressure approaches 760 millims., and it is very improbable that its viscosity would remain the same if the pressure were to be considerably increased. Between 5 and 35 millims. the respective viscosities of carbonic anhydride, carbonic oxide, nitrogen, oxygen, and air scarcely vary at all, showing that between these limits they are practically as "perfect" gases as hydrogen is throughout the whole barometric range from 760 millims. to 1 millim., and here therefore they obey Maxwell's law as perfectly as hydrogen does. The change to the ultra-gaseous state commences to be assumed at about an exhaustion of half a millim. In hydrogen the change then proceeds slowly, but in the less perfect gases experimented with, the change to ultra-gas takes place with greater rapidity.

In gases, variation of pressure in different parts of a closed vessel equalises itself with great rapidity, but in the ultra-gaseous state differences of pressure may exist for twenty minutes or more in different parts of the apparatus.

In gases, electrically charged bodies do not permanently retain their charge, but gradually discharge themselves. In ultra-gas, however, a pair of electrified gold leaves have remained repelled at absolutely the same angle for thirteen months.[1]

Another property of gases is that of facilitating the cooling of bodies immersed in them, by communicating an increase of motion to the molecules of the gas which carry it to the walls of the containing vessel,—*i.e.* by *carriage* instead of *convection*. There is little difference in the rate of cooling with increased exhaustion, so long as we work with such ordinary good vacua as can be obtained by air-pumps. For if, on the one hand, there are fewer molecules impinging on the warm body (which is averse to the carriage of heat), yet, on the other hand, the mean length of path between collisions is increased so that the augmented motion is carried farther; the number of steps by which the temperature passes from the warmer to the cooler body is diminished, but the value of each step is correspondingly increased. Hence the difference of velocity before and after impact may make up for the diminution in the number of molecules impinging.

In gases, therefore, the rate of cooling is little affected by rarefaction, the law in this case being analogous to that governing the viscosity.

In a paper which the author has recently read before the Royal Society,[2] he shows that when the exhaustion is carried to so high a point that the mean free path is comparable with the diameter of the containing vessel, the rate at which heat is conveyed across is much diminished. The molecules are now in the ultra-gaseous state, and further exhaustion produces a notable fall in the rate of cooling, an increase of exhaustion from 20 M to 2 M retarding the carriage of heat more than all the previous exhaustion from 760 millims. to 20 M.

The author has shown elsewhere[3] that the property of gaseity is pre-eminently a property dependent on collisions. A given space full of air at the ordinary pressure contains millions of millions of molecules rapidly moving in all directions, each molecule momentarily encountering millions of other molecules in a second. In such a case the length of the mean free path of the molecules is exceedingly small compared with the dimensions of the containing vessel, and those properties are observed which constitute the ordinary gaseous state of matter—properties which depend upon constant collisions.

The gaseous state continues so long as the collisions are almost infinite in number, and of inconceivable irregularity. But in such high vacua as are now described the free path of the molecules is made so long that the hits in a given time may be disregarded in comparison to the misses, and the average molecule is allowed to obey its own motions or laws without interference; and when the mean free path is comparable to the dimensions of the containing vessel, the properties which constitute gaseity are reduced to a minimum, and the matter then becomes exalted to an ultra-gaseous state.

In the ultra-gaseous state properties of matter which exist even in the gaseous state are shown *directly*, whereas in the state of gas they are only shown *indirectly*, by viscosity and so forth.

The ordinary laws of gases are a simplification of the effects arising from the properties of matter in the ultra-gaseous state; such a simplification is only permissible when the mean length of path is small compared with the dimensions of the vessel. For the sake of simplicity we make abstraction of the individual molecules, and feign to our imagination *continuous* matter of which the fundamental properties—such as pressure varying as the density, and so forth—are ascertained by experiment. A gas is nothing more than an assemblage of molecules contemplated from a simplified point of view. When we deal with phenomena in which we are obliged to individually contemplate molecules, we must not speak of the assemblage as *gas*.

An objection has been raised touching the existence of ultra-gaseous matter in highly-exhausted electrical tubes, that the special phenomena of radiation and phosphorescence which the author has considered characteristic of this form of matter can be made to occur at much lower pressures than that which exhibits the maximum effects. For the sake of argument let us assume that the state of ultra-gas with its associated phenomena is at the maximum at a millionth of an atmosphere. Here the mean free path is about 4 inches long, sufficient to strike across the exhausted tube. But it has been shown by many experimentalists that at exhaustions so low that the contents of the tube are certainly not in the ultra-gaseous state, the phenomena of phosphorescence can be observed. This circumstance had not escaped the author's notice. In his first paper on the "Illumination of Lines of Molecular Pressure and the Trajectory of Molecules"[1] the author drew attention to the fact that a molecular ray producing green phosphorescence can be projected 102 millimetres from the negative pole when the pressure is as high as 0·324 millim. or 427 M. In this case the mean free path of the molecules is 0·23 millim.; and it is not surprising that with more powerful induction discharges, and with special appliances for exalting the faint action to be detected, the above-named phenomena can be produced at still higher pressures.

It must be remembered that we know nothing of the *absolute* length of the free path or the *absolute* velocity of a molecule; these may vary almost from zero to infinity. We must limit ourselves to the *mean* free path and the *mean* velocity, and all that these experiments show is that a few molecules can travel more than a hundred times the *mean* free path, and with perhaps a corresponding increase over the *mean* velocity, before they are stopped by collisions. With weak electrical power the special phosphorogenic action of these few molecules is too faint to be noticed; but by intensifying the discharge the action of the molecules can be so increased as to render their presence visible. It is also probable that the absolute velocity of the molecules is increased so as to make the mean velocity with which they leave the negative pole greater than that of ordinary gaseous molecules. This being the case, they will not easily be stopped or deflected by collisions, but will drive through obstacles and so travel to a greater distance.

If this view is correct, it does not follow that gas and ultra gas can co-exist in the same vessel. All that can be legitimately inferred is, that the two states insensibly merge one into the other, so that at an intermediate point we can by appropriate means exalt either the phenomena due to gas or to ultra gas. The same thing occurs between the states of solid and liquid and liquid and gas. Tresca's experiments on the flow of solids prove that lead and even iron, at the common temperature, possess properties which strictly appertain to liquids, whilst Andrews has shown that liquid and gas may be made to merge gradually one into the other, so that at an intermediate point the substance partakes of the properties of both states.

Note on the Reduction of Mr. Crookes's Experiments on the Decrement of the Arc of Vibration of a Mica Plate oscillating within a Bulb containing more or less Rarefied Gas[2]

THE determination of the motion of the gas within the bulb, which would theoretically lead to a determination of the coefficient of viscosity of the gas, forms a mathematical problem

[1] *Proceedings* of the R. S., No. 193, 1879, p. 347.
[2] *Proc.* R. S., No. 208, 1880, p. 239.
[3] *Proc.* R. S., No. 205, 1880, p 469.

[2] Abstract of a paper read before the Royal Society, February 17, by Prof. G. G. Stokes, Sec.R.S.

of hopeless difficulty. Nevertheless we are able, by attending to the condition of similarity of the motion in different cases, to compare the viscosities of the different gases for as many groups of corresponding pressures as we please. Setting aside certain minute corrections which would have vanished altogether had the moment of inertia of the vibrating body been sufficient to make the time of vibration sensibly independent of the gas, as was approximately the case, the condition of similarity is that the densities shall be as the log decrements of the arc of vibration, and the conclusion from theory is that when that condition is satisfied, then the viscosities are in the same ratio. Pressures which satisfy the condition of similarity are said to "correspond."

It was found that on omitting the high exhaustions, the experiments led to the following law :—

The ratios of the viscosities of the different gases are the same for any two groups of corresponding pressures. In other words, if the ratios of the viscosities of a set of gases are found (they are given by the ratios of the log decrements) for one set of corresponding pressures, these pressures may be changed in any given ratio without disturbing the ratios of the viscosities.

This law follows of course at once from Maxwell's law, according to which the viscosity of a gas is independent of the pressure. It does not however by itself alone prove Maxwell's law, and might be satisfied even were Maxwell's law not true. The constancy however of the log decrement, when the circumstances are such that the molar inertia of the gas may presumably be neglected, proves that at any rate when the density is not too great that law is true; and the variability of the log decrement at the higher pressures in all but the very light gas hydrogen is in no way opposed to it, though Mr. Crookes's experiments do not enable us to test it directly, but merely establish a more general law, which embraces Maxwell's as a particular case.

The viscosities referred to air as unity which came out from Mr. Crookes's experiments were as follows :—

Oxygen	1·117
Nitrogen and carbonic oxide	0·970
Carbonic anhydride	0·823
Hydrogen	0·500

The viscosity of kerosoline vapour could not be accurately deduced from the experiments, as the substance is a mixture, and the vapour-density therefore unknown. Assuming the relative viscosity to be 0·0380, the vapour-density required to make the experiments fit came out 3·408 referred to air, or 49·16 referred to hydrogen.

When once the density is sufficiently small, the log decrement may be taken as a measure of the viscosity. Mr. Crookes's tables show how completely Maxwell's law breaks down at the high exhaustions, as Maxwell himself foresaw must be the case. Not only so, but if we take pressures at those high exhaustions which are in the same ratios as "corresponding" pressures, the log decrements in the different gases are by no means in the ratios of the densities.

It would appear as if the mechanical properties of a gas at ordinary pressures and up to extreme exhaustions (setting aside the minute deviations from Boyle's law, &c.) were completely defined by two constants, suppose the density at a given pressure and the coefficient of viscosity; but that specific differences come in at the high exhaustions at which the phenomena of "ultra-gas" begin to appear; and that to include these, an additional constant, or perhaps more than one, requires to be known.

ANIMAL REMAINS IN THE SCHIPKA CAVERN

ON December 6, 1880, Prof. Schaaffhausen gave a lecture to the Lower Rhine Society in Bonn, on the discoveries made by Prof. Maschke in the Schipka Cavern, near Stramberg, in Moravia. In this cavern were found remains of Bos, Ursus, Elephas, Rhinoceros, Leo, and Hyæna, besides roughly-hewn implements of quartzite, basalt, and flint, and some incisor teeth of Ursus, which were cut into on both sides at the beginning of the crown, perhaps because people did not yet know how to bore a hole into the root. Carbonised animal bones in numerous small fragments were met with. A solitary human relic was found in a protected place at the wall of a side passage of the cavern, and near a fireplace. It was the fragment of a lower jaw, amid ashes and inter-breccia of lime. The same layer contained mammoth remains and ston

SOME REMARKS ON
EDWARDSII, B

SINCE I learnt from Mr. Moseley
Peripatus (Ann. and Mag. of N
that one of them, referred by Grube
obtained from this country, in the
Tovar[1]), I tried to get specimens

[1] Not Colony *Tovar*, as the name is print

animal. But all my efforts being unsuccessful for a long time, I finally lost all hopes, and the pressure of other business, scientific and not scientific, caused me to lay the matter on the shelf, little thinking that I had my *desideratum* close at my elbows.

There is within our University building a large square yard, where stones, old bricks, and other such refuse had been accumulating in the course of years. About a month ago it was fortunately resolved to transform this very ugly place into a garden, and I engaged the workmen to bring me any kind of animal they might turn up under the heaps of rubbish. How great was my satisfaction to find in the very first gatherings half a dozen of *Peripatus* among some common beetles, centipedes, and earthworms! I offered immediately a prize for every other specimen of the former, and so good proved the locality that in a few days I was in possession of more than fifty of these unexpected *cives academici* of ours, the supply being apparently far from exhausted.[1]

As there are still some points in the natural history of *Peripatus* which are not well settled, I beg leave to offer the following remarks based on the careful examination of living or dissected specimens.

The number of females appears to be much larger than that of males; for among fifty-three specimens I found only five males, which are about half the size of the females. These are

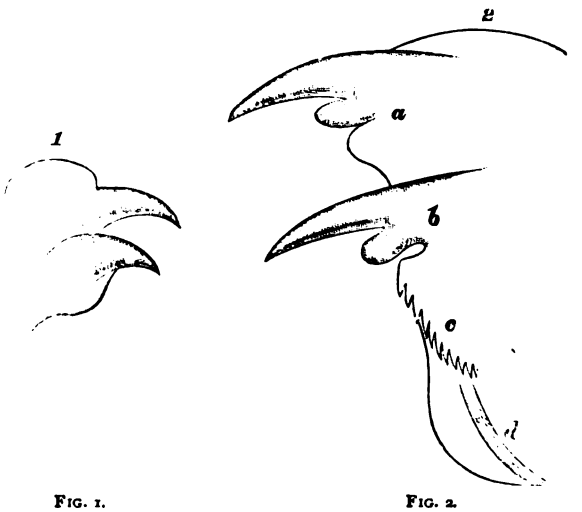

FIG. 1. FIG. 2.

FIG. 1.—Horny claws of one of the foot-jaws in the young animal when born. FIG. 2.—The same, from an adult female. *a*, first claw; *b*, second claw; *c*, horny saw; *d*, pigment-line.

sometimes nearly 1 decimetre long, 5 to 6 millimetres broad, and somewhat tapering on both extremities. The colour is brownish black, with a diffused black line on the middle of the back; the ventral side is dark flesh-coloured. Full-grown animals have thirty-one pairs of ambulatory feet, the new-born animals have but twenty-nine; the length of the latter is about 25 millimetres, their breadth two, the tentacles measure 3 mm.; their colour is reddish, with a line of somewhat lozenge-shaped figures of a paler tint running down the middle of the back.

I twice observed the birth of a young *Peripatus*. The mother raised slightly the hind part of the body, moving it slowly from one side to the other. After some minutes the head of the embryo protruded from the sexual porus, and in half an hour half the body came out, twisting around all the while in every direction. The old animal remained rather quiet, moving occasionally its head, but not crawling about. As soon as the process was advanced thus far, the young *Peripatus* clung with its feet to the nearest surface in its reach; and the mother walking off, the hind part of the embryo came forth in a few seconds.

In one case a young *Peripatus* was born in a tumbler of water, in which I had placed the mother, in order to kill it in an extended condition, as recommended by Moseley in his well-known paper in the *Phil. Transactions*. I did not see the birth, but found the young animal already crawling on the back of the mother, and there floated in the water close by a very thin skin of the size of the young animal, exhibiting its whole form, even the tentacles. I suppose it must have been shed soon after birth, but have failed hitherto to see anything alike in the other cases of birth, which I watched very carefully.

I could not well make out the number of articulations in the tentacles; there are, however, more than thirty in those of the young animal, having each a ring of short spiny bristles at the base. The slime-glands of the young *Peripatus* are already well developed. It has twenty-nine pairs of feet; and as the adult animal has never more than thirty-one, there must be specimens with the intermediate number of thirty, which would settle Mr. Moseley's question (*Ann. and Mag. of Nat. Hist.*, l. c.) It is probable that *Peripatus* goes through several moultings, and that the new feet then make their appearance.

This may be further surmised from the development at the horny claws of the foot-jaws, which are simple, and not indented in the young animal, but of a much more complicate structure

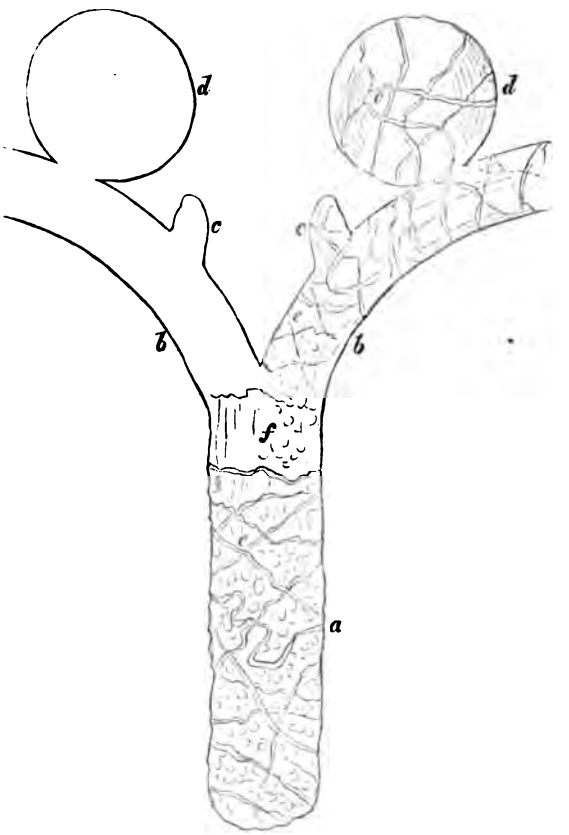

FIG. 3.—Schematic sketch of ovary (*a*), beginning of oviducts (*b*), cæca (*c*), receptacula seminis (*d*), covered by tracheal tubes (*e*), zone of ovary without tracheal tubes (*f*).

in the old one. The annexed figures represent these claws in both conditions.

In the adult animal there is first a large pointed tooth, then follows a shorter one, which is obtuse; both are formed apparently of three to four superposed lamellæ, the outlines of which are distinctly visible by changing the focus of the microscope. The second maxillary claw has likewise two teeth of the same shape and structure, but bears behind them a kind of saw, composed of ten small teeth of the same amber-yellow colour as the inner parts of the larger teeth. This saw is followed by an oblique line of a yellowish pigment, perhaps the rudiment of another developing saw, or a reservoir of horny matter.

The structure of the sexual organs may deserve a few remarks. There can be no doubt that the sexes are separate. The male organs are very much like those described by Moseley in his paper; only the *vesiculæ seminales* are not nearly so spirally twisted as in his figure on plate lxxii. The testes contain spermatozoa of the same shape as those of *P. Capensis*. I noticed

[1] Those desirous of obtaining specimens from me in exchange for books or papers on zoological topics, will be good enough to write to me.

that the slime-glands were much less developed in the males than in the females.

The structure of the female organs in our Caracas species agrees pretty well with Prof. Hutton's drawings (*Ann. and Mag. of Nat. Hist.*, iv. ser., vol. 18, pl. xvii., fig. 8); but I am not prepared to accept his interpretation. The following sketch will give an idea of what I saw.

Moseley's Fig. 1 on pl. lxxiv. is very different from the shape of the ovary in our species; nor can I well understand the existence of ova on the *outside* of the ovary as they appear in his drawing. The ovary in *P. Edwardsii* is rather long, and abundantly covered by fine tracheal tubes, with the exception of a narrow zone close to the branching out of the oviducts. I could not satisfy myself as to its being divided by a septum, nor could I find any ova in it; most likely it is not now the right time. At a very short distance from the beginning of the oviducts there is a kind of obtuse *cæcum* on each of them, which is followed by a spherical body covered by tracheal tubes. These bodies are the organs described by Prof. Hutton as testes.

There is however in our species no trace of what he takes for *vasa deferentia*, the spherical body adhering directly to the oviduct. Its wall is of considerable resistance, and bursts only under great pressure, giving issue to an immense number of thin rod-like corpuscula, which soon after begin to move slowly in the surrounding water. They are of course spermatozoa which have lost their nuclei, and the spherical body can therefore be nothing else but a *receptaculum seminis*.

The oviducts of three specimens which I dissected contained very few embryos; in one there was only one in each oviduct, in the others there were two. They were fully developed, and occupied the part of the oviducts close to the vulva. It would appear from this that the time of reproduction is now almost over; further observations will show whether there is really such a periodicity in our species.

It is probable that the oviducts of *P. Edwardsii* never present the shape of strings of sausages, as seen by Mr. Moseley in *P. Capensis*, the embryos being so considerably larger.

Animals thrown alive into alcohol pour forth from their slime-glands first the viscid substance contained in these; then there comes out a slightly reddish matter, which dissolves in the alcohol, giving it the same colour.

With respect to all other points I can only confirm Mr. Moseley's statements. I keep alive a colony of *Peripatus* of both sexes in the hope to have once a chance to observe the copula.

I cannot conclude these remarks without confessing that I am not at all quite sure whether our *Peripatus* is really *P. Edwardsii*, as the figure of this species in Nicholson's "Manual of Zoology" (5th edit. p. 315), which is said to be after Grube, does not agree well with my living specimens. Grube's original paper I cannot consult here. It may be however that he made his drawing from a contracted alcoholic specimen. A. ERNST

The University, Carácas, January 16

ACOUSTICS IN CHINA

THE following letter to Prof. Tyndall has been sent to us for publication by the writer, Mr. Fryer. It will be seen that a really scientific modern correction of an old law has singularly turned up from China, and has been substantiated with the most primitive apparatus. Dr. W. H. Stone, to whom the letter has been submitted, has kindly appended a note.

TO PROF. TYNDALL, LL.D., F.R.S., &c.

DEAR SIR,—My friend Mr. Hsü has brought some interesting facts relating to acoustics before my notice. As he is the father of the native official who translated with me your work "On Sound," and as he refers particularly to that work, I venture to forward you a translation of his remarks, in the hope that you will satisfy his mind on a subject in which he takes such deep interest. He says:—

"In ancient Chinese works on music it is stated that strings or pipes produce an octave or twelve semitones higher or lower by halving or doubling their length.

"In a work written during the Ming dynasty by Chen-toai-yoh it is stated that this rule will only hold good with strings, but not with open pipes such as the flute or flageolet.

"Some years ago I tried to investigate the cause of this difference and its exact amount. A round open brass tube, say nine inches long, gave a certain note by pressing the end of it against the upper lip and blowing through an *embouchure* made there. Cutting off half the tube, the remaining four and inches would not sound the octave; but by cutting off inch more, thus leaving four inches in length, the oct sounded accurately. This experiment was tried on various lengths and diameters with a similar result, four-ninths of the length always sounded the octave mo exactly. Looking at a foreign keyed flute I noticed t principle carried out in the arrangements for producing I could not however see the reason why open pipes sh follow the same rule as strings and closed pipes.

"When I read the translation of Prof. Tyndall's 'On Sound,' I was surprised to find the old Chin strictly maintained. It says (p. 214): 'In both st open pipes the number of vibrations executed in a giv inversely proportional to the length of the pipe,' &c. A to this, as the octave of any note has to execute exactly d number of vibrations in a given time, an open pipe oc exactly halved to make it sound an octave higher. Th shown to be erroneous by my experiments.

"Fearing that I have misunderstood the English meaning, I beg that he may be written to on this su that my doubts may be thereby cleared up. What know is the exact proportion in length that exists be open pipe and a pipe of similar diameter sounding higher. Also the exact proportions in length for e open pipes sounding the twelve semitones which form one octave. If the length forming the octave in c does not agree with the length for strings or closed the lengths of all the pipes giving intermediate notes differ. How are these lengths to be calculated? C expressed by any mathematical curve or formula? not the same rule hold good for open pipes as fo stopped pipes? I have a theory of my own, but I sufficient confidence in myself to make it public u bestowed more thought and attention upon it. In th I shall be glad if any foreign scientists can enable m stand this interesting and important subject. The practice of music in China has gradually become vitia errors in the construction of musical instruments, therefore desirous of having a scientific basis up reformation may be effected."

There is no treatise on music or acoustics that I ca throws any light on these interesting questions, therefore deem it a great favour if you will direc work that will enable me to satisfy the eager inq native friend.

I send by book-post a pamphlet for your kind containing an account of the Department for the T Scientific Books at the Kinagnan Arsenal. You your "Notes on Light" are now published in Chin will be forwarded to you shortly. Your "Heat Motion" I hope to begin to translate at no very Your "Notes on Electricity" in Chinese will shortly.

I remain, dear Sir, yours faithfully,

Shanghai, June 1, 1880 Jo

November

P.S.—I have sent a copy of this letter to t NATURE, and shall feel greatly obliged if you will reply, if any, to him for publication.—J. F.

MR. FRYER is perfectly correct in his observatio find the explanation and formula needed at p. 16 book on Sound, under the heading "Correction o Law." "It has long been known," I there say, open pipe be stopped at one end its note is not exa below that given by it when open, but somewhat le being about a major seventh instead of an octave."

Then follows the mathematical statement, fr corrections needed by Mr. Fryer could easily be Bosanquet's excellent experimental investigation of briefly described. His results give the correctio end of the pipe as ·635 of radius of pipe, and mouth. Mr. Bosanquet remarks that in Bernouill hypothesis is made that the change from the the pipe to a condition in which no remains of to be perceived takes place *suddenly* at the point w system leaves the pipe. It is however evident th ence which takes place may be conceived of as e the pipe *a series* of reflected impulses, instead

from the open end of the pipe
y, and that these elementary im-
distances, may be altogether
impulse from a point at a little
ipe. It is not a little interesting

SOCIETIES AND ACADEMIES

LONDON

Zoological Society, March 1.—Prof. W. H. Flower, F.R.S., president, in the chair.—The Secretary exhibited the cast integument of a large spider (*Mygale histrioia?*) which had been shed in the Society's Gardens.—Mr. G. E. Dobson, C.M.Z.S., read a paper on the anatomy of the family *Erinaceidæ*, commencing with that of the curious and rare form *Gymnura Rafflesii*, with which the species of *Erinaceus* were compared. *Gymnura* was shown to be a peculiarly central form, the survivor probably of a once widely-spread group. Altogether the anatomy of thirteen species of Erinaceidæ was treated of in this paper.—A communication was read from Mr. F. Moore, F.Z.S., containing the descriptions of some new genera and species of Asiatic nocturnal lepidoptera. The characters of 150 new species were given, representing eighty-two genera, of which twenty-nine were new to science.—A communication was read from Mr. R. Collett, C.M.Z.S., containing an account of the breeding habits of the grey seal (*Halichœrus gryphus*), as observed on the Fro Islands, off Trondhjem's Fiord, in Norway.—Mr. R. Bowdler Sharpe, F.Z.S., read a note on the fantail flycatcher of Western Australia (*Rhipidura preissi*), of which he had lately had for the first time an opportunity of examining a specimen.

Geological Society, February 23.—Robert Etheridge, F.R.S., president, in the chair.—William Henry Goss was elected a Fellow of the Society.—The following communications were read:—A letter from Dr. John Kirk, communicated to the Society by the Right Hon. Earl Granville, dated H.M. Agency and Consulate General, Zanzibar, December 20, 1880. "It may be of interest to record the occurrence here of an earthquake shock felt in the island of Zanzibar at 6.58 a.m., mean time, on the morning of the 15th inst. Although the shock was very distinct no damage appears to have been done to any buildings in town. It is now twenty-four years since a similar shock has been here noticed; but on the mainland, espe-

cially in the vicinity of Ujiji, they are both more common and more severe than at the coast. Shortly after the cable was laid between Mozambique and Delagoa Bay, the communication was suddenly interrupted after one of these earthquake shocks, which seems to have caused the falling in of rocks by which the cable was crushed."—The Permian, Triassic, and Liassic rocks of the Carlisle Basin, by T. V. Holmes, F.G.S. The district discussed in the author's paper was worked over by him when engaged on the geological survey, and consists of those parts of Cumberland and Dumfriesshire which adjoin the Solway. Its southern boundary is, approximately, a line ranging from Maryport to Rose Castle on the River Caldew, and touching the Eden about two miles above Wetheral. On the east and north-east its limits are the immediate neighbourhoods of the junction of the rivers Eden and Irthing, Hethersgill on the Hether Burn, Brackenhill Tower on the Line, and the border boundary on the Rivers Esk and Sark; and in Dumfriesshire the small tract south of a line ranging from the junction of Scots Dyke with the Sark on the north-east, to Cummertrees on the south-west. The lowest bed in this area is the great Upper Permian or St. Bees Sandstone, which occupies a belt of country in the neighbourhood of the outer boundary. Directly above St. Bees Sandstone, in the west of the district, lies a formation consisting of shales with gypsum, which, though 700 feet thick in the neighbourhood of Abbey Town, is nowhere visible, but is known solely from borings, the country west of the Caldew, and of the Eden below the junction of the two streams, being thickly drift-covered and almost sectionless. In the east of the district the St. Bees Sandstone is overlain directly by a soft, red, false-bedded sandstone, called by the author Kirklinton Sandstone, from the locality in which the rock is best seen, as well as its relations to the under- and overlying beds. But while there is no evidence of any unconformity between the St. Bees Sandstone and the overlying Gypseous Shales in the west, there is evidence of a decided unconformity between the St. Bees and Kirklinton Sandstones in the east. In Carwinley Burn (for example), which runs into the Esk at Netherby, only from 200 to 300 feet of St. Bees Stone was seen below the outcrop of the Kirklinton, instead of the 1000 to 1500 feet which probably exist about Brampton on the one hand, and in Dumfriesshire on the other. Yet Carwinley Burn affords an almost continuous series of sections, from the (non-faulted) Permian-Carboniferous junction to some distance above the outcrop of the Kirklinton Sandstone. As, in addition, the shales underlying the St. Bees Sandstone are gypseous, both near Carlisle and at Barrowmouth, close to St. Bees Head, the author classed the (Upper) Gypseous Shales as Permian, and the Kirklinton Sandstone as Bunter. Resting unconformably on the Kirklinton Sandstone, in the district between Carlisle and Kirklinton, are the Marls seen on the Eden, between Stanwix and Beaumont, and on the line between Westlinton and Cliff Bridge, Kirklinton. Their unconformity is shown by the fact that on the line they rest on the lower, or red, beds, and between Stanwix and Beaumont on the upper, or white, beds of the Kirklinton Sandstone. The Marls have therefore been classed as Keuper. So far as the evidence goes they appear to be very thin, and to extend but a very small distance south of the Eden. Lastly, the Lias appeared to the author to be unconformable to all the beds below, and to rest partly on the Gypseous Shales, partly on the Kirklinton Sandstone, and partly on the Keuper Marls. Of the existence of Rhætic beds there was no evidence, all fossils hitherto found having been determined by Mr. Etheridge (the president) to be Lower-Lias forms. But the Lias-sections are so small and few in number, and the ground so persistently drift-covered, that only a boring could settle the question.—On *Astroconia Granti*, a new Lyssakine Hexactinellid from the Silurian formation of Canada, by Prof. W. J. Sollas, M.A., F.G.S. This paper contained a description of a new fossil Hexactinellid sponge from the Niagara chert beds of Hamilton, Ontario. It is the second oldest known example of the Lyssakina.

Anthropological Institute, February 8.—Major-General A. Pitt-Rivers, F.R.S., president, in the chair.—The election of the following new members was announced: A. G. Geoghegan, E. H. Man, Owen Roberts, and Bruno Müller.—Mr. W. L. Distant exhibited some Carib chisels from Barbadoes, which had been sent to him by Mr. W. J. Sollas, of Bristol. They were taken with about 100 more from a cave, and were found six or eight inches below the surface. The cave is about 350 feet above the sea level, and is situated at a distance of two miles from the coast.—Mr. A. L. Lewis read a paper on two stone circles in Shropshire. Between five and six miles west Minsterly is a circle of small stones known as the "Hoarstone." The largest stone is in the centre and is surrounded by the three stones and fragments arranged in a circle about 74 feet diameter. About a mile and a half in a south-westerly direction from the Hoarstone is another circle called in Gough's "Camden Britannia" "Madge's Pinfold." Here thirteen stones and the fragments stand and lie in an oval ring, the diameters of which are about 86 feet and 92 feet, the longest diameter running north-west and south-east.—Miss A. W. Buckland read a paper on surgery and superstition in neolithic times; the object which was to bring before the Institute the frequent practice trepanning in Neolithic times, as proved by the late Dr. Broca to call attention to the proofs he has given of the facts, and his explanation of the reason of the practice, and of the superstitions associated with it, as also its connection with the use of cranial amulets.

Physical Society, February 26.—Prof. Fuller in the chair. The former resolution regarding the moneys of the Society for investment was adopted.—Dr. O. J. Lodge exhibited a mechanical apparatus illustrating the fact that conductors of electricity are opaque to light, and showed by means of Wheatstone's photometer, which combines two circular motions into a harmonic one, how the plane of polarisation of a beam of light passing through a magnetic medium is rotated.—Mr. C. V. Boys exhibited his new integrating machine, which is the first one illustrative of the mathematical process of integration, and is therefore specially valuable for teaching purposes.—Mr. Shelford Bidwell read a paper on the telegraphic transmission of pictures of natural objects. The process is explained as follows:—The positive pole of a battery is connected through a set of resistance-coils to a piece of platinum wire, and the negative pole to a plate of zinc, upon which is placed a sheet of paper moistened with a solution of potassium iodide. The negative pole of a second battery is connected through a selenium cell with the same platinum wire, and the positive pole to the zinc plate. The point of the platinum wire is pressed on to the paper, and the selenium being exposed to a strong light, the variable resistance is so adjusted that the currents from the two batteries which pass through the paper in opposite directions exactly neutralise each other. The platinum point will now make no mark when drawn over the paper; but if the selenium is shaded, its resistance is immediately increased: the current from the first battery then predominates, and the path of the platinum point across the paper is marked by a brown line due to the liberation of iodine. The line is fainter the feebler the light is. This arrangement has been applied by Mr. Bidwell in his "telephotograph," exhibited to the meeting. The transmitter consists of a brass cylinder mounted on a screw spindle which carries the cylinder laterally $\frac{1}{100}$ inch at each revolution. A pin-hole in the middle of the cylinder allows light to fall upon a selenium cell placed behind it within the hollow cylinder. The cell is connected in circuit with a battery and the line. The receiver consists of a similar metal cylinder mounted so as to rotate synchronously with the first, and having a platinum point pressing upon a sheet of chemical paper wrapped round the cylinder. This receiver and transmitter are connected up as described above with two batteries and a set of resistance-coils. The image to be transmitted is focussed upon the cylinder of the transmitter and the resistance adjusted, and the receiving cylinder covered with sensitised paper. The two cylinders are caused to rotate synchronously, the pin-hole in the course of its spiral path covering successively every point of the focussed picture. The amount of light falling upon the selenium will be proportional to the illumination of that particular spot of the projected image which is for the time being occupied by the pin-hole, and the intensity of the line traced by the platinum point in the receiver will vary in the same proportion. These variations will produce a picture which, if the instrument were perfect, would be a counterpart of that projected upon the transmitter. Simple designs cut out of tin-foil and projected by a lantern have been successfully transmitted. With selenium and paper of greater sensitiveness more perfect results might undoubtedly be obtained.—Professors Ayrton and Perry showed an experiment illustrating their plan for sending light and shade images by electricity. A selenium cell was connected in circuit with a battery and a coil of wire surrounding a tube along which a beam of light passed. A shutter having a small magnet attached was suspended in the tube like a galvanometer mirror, so that when a current traversed

e coils the shutter was deflected so as to close or partially close e tube and shut off the beam of light. It will be understood that hen a ray of light fell on the cell and diminished its resistance, ie current in the coils would increase to a degree proportional to ie intensity of the ray, and thus the shutter would proportionally ut off the light in the receiver. If now a number of these lementary circuits were combined so as to provide a mosaic of ells to transmit the reflected image of an object, and a screen o receive the corresponding beams of light controlled by the hutters at the other end of the line, there would be a means of ending light and shade images by wire. A rapidly rotating rm carrying a row of cells upon it might answer for a stationary nosaic transmitter, and need fewer cells, while a Japanese mirror aving its curvature altered by electromagnets behind might be made to act as a receiver; the "magic" images of that mirror being due to inequalities of curvature. Prof. Ayrton agreed with Mr. Bidwell in his conclusion that selenium cells of high resistance were more sensitive to light than cells of low resistance. Dr. Coffin suggested that Mr. Bidwell should adopt other than the cylindrical form of receiver, and move an image of the object across the pin-hole. Prof. G. C. Foster advised bringing the light always on one and the same part of the selenium cell.

Quekett Microscopical Club, February 25.—T. C. White, president, in the chair.—Ten new Members were elected, and numerous donations received.—A communication was made by Mr. A. D. Michael, announcing the discovery by Mr. Beaulah of *Myobia musculi* upon a mole, this parasite having been previously regarded as one confined to mice. A discussion ensued as to the frequent errors in classification and nomenclature arising from insufficient observation.—The Rev. J. E. Fase exhibited and described a convenient form of grooving slide, which could be used either with high- or low-power objectives.

Institution of Civil Engineers, February 22.—Mr. Abernethy, F.R.S.E., president, in the chair.—The paper read was on the weight and limiting dimensions of girder bridges, by Mr. M. am Ende, Assoc. M. Inst. C.E.

Edinburgh

Royal Society, February 7.—Prof. Maclagan, vice-president, in the chair.—After reading the obituary notices of Lord Ormidale, Dr. Sharpey, Mr. Lassell, and other deceased Fellows, the chairman called on Prof. George Forbes to communicate his paper on a simple and accurate method of determining the longitude of a place by a single observer without the aid of any instrument for measuring time. The method consisted in taking advantage of the daily change in the moon's declination, which for four or five days during each lunation was sufficiently rapid to be measured with considerable accuracy by means of a sextant and artificial horizon. The calculations and reductions were too intricate to be effected save by a method of approximation and interpolation such as that which the author had given in his paper.—Mr. J. Y. Buchanan read a short paper from Prof. Liversidge descriptive of a specimen of Stilbite that had been brought by the *Challenger* from Kerguelen's Island.—Prof. J. Blyth gave an interesting account of certain experiments which he had made with a simple form of selenium cell. Two ordinary metal combs with every alternate tooth broken away were set close together, so that each remaining tooth in either fitted without touching into the interstice between two remaining teeth in the other. The two combs were then brought into electrical contact by the selenium, which was poured in between the teeth; and thus a selenium cell was formed with a large surface and small resistance. In one special form of cell the combs were bent round a glass tube, inside which a singing flame was set. The accompanying rhythmic fluctuations in the luminosity of the flame were reproduced as sound in the telephone receiver. The difficulty of getting good selenium at the time induced the author to try if amorphous phosphorus would serve as a substitute. A "radial cell," in which the interstices between the dove-tailing electrodes were filled with phosphorus, was found to be not sensitive to light; but such an arrangement was discovered to be a battery in itself, giving rise to currents which varied with the pressure that was brought to bear upon the phosphorus. This property at once suggested a phosphorus cell as a possibly useful transmitter in a telephonic circuit. Another curious effect was noted, viz. that phosphorus under the action of a variable current glowed with a beautifully varying phosphorescence.—Mr. Aitken communicated further experiments on the formation of fogs. His former experiments he had repeated at as low temperatures as 8° F., invariably finding that in filtered air no fog formed. Discussing the production of dry fogs, *i.e.* fogs that are formed in *non-saturated* air, the author pointed out that certain kinds of fog-forming dust were much more efficient in their action than others. Some, in virtue probably of their deliquescent properties, formed clouds in non-saturated air; others only acted in saturated air; while a third class required the air to be super-saturated. In connection with the change of state of moisture in the atmosphere, Mr. Aitken explained the formation of the various forms of ice-crystals by application of the principle that the slower the crystallisation the more regular and simple it is. Hence complex types of crystals betoken a rapid crystallisation. The paper ended with a few instructive remarks upon liquid surface-tension as an important factor in the growth and coalescence of raindrops as they descend towards the earth.—Prof. Tait, in a short note on thermal conductivity, intimated that he had solved the equation for conduction, taking into account the temperature-variations of the conductivity and specific heat. He further pointed out that, at least in the case of iron, most of the decrease with temperature that apparently takes place in the value of the conductivity is in all likelihood referable at once to the change in specific heat; so that perhaps after all conductivity varies very slightly indeed with temperature, and is practically constant through ordinary ranges. Prof. Tait also gave a simple experimental illustration of the diminution in the surface-tension of water produced by heating. A red-hot poker was held close over a level water surface on which Lycopodium dust was sprinkled, when at once the dust was drawn away to cooler regions as if violently repelled by the strongly-heated metal.—Dr. Haycraft communicated a paper in which he showed that the hepatic cells of man and other domestic animals, several of which he had examined, are possessed of true cell-walls. These may be demonstrated by placing a few scrapings from a fresh organ on a slide, and pressing the cover-glass down so as to crush them. The membranes are then to be seen projecting from the half-broken cells, or scattered about the preparation.

Boston, Mass., U.S.A.

American Academy of Arts and Sciences, February 9.—The president, Prof. J. Lovering, in the chair.—Prof. H. P. Bowditch presented some observations on the senses of sight and touch. An observer having noticed the position of a point at the centre of a target, shut his eyes, and after a measured interval of time attempted to touch this point again. It was found that the attempts were more successful when two seconds had elapsed than in the cases when more or less time had intervened.—Mr. N. D. C. Hodges read a paper upon the thermodynamic basis for the kinetic theory of gases. By means of the fundamental equations of thermodynamics the mathematical analysis of the kinetic theory results at once; and an expression is obtained for the absolute mass of a molecule.—Prof. Pickering, in a paper on variable stars, discussed their changes in brilliancy and grouped them according to a new law.—Mr. Arthur Searle gave some of the results of his observations on the zodiacal light.—Mr. Harold Whiting, in an abstract of a forthcoming paper, stated that he had found the rate of propagation of what may be called the magnetic wave to vary from 30 feet to 300 feet per second.—Prof. Goss presented some observations on the strength of fir beams.

Paris

Academy of Sciences, February 21.—M. Wurtz in the chair.—The following papers were read:—Meridian observations of small planets at Greenwich and Paris Observatories during the fourth quarter of 1880, communicated by M. Mouchez.—On the parallax of the sun, by M. Faye. He indicates in a table nine methods of determining the earth's distance from the sun. He holds that the method of physicists is best; that the sun's parallax, 8″·813, is now determined by them to within $\frac{1}{100}$ of a second; and that the seven astronomical methods converge more and more towards this result, and tend to confirm it, without having equal certainty.—Male eels, compared with the females, by M. Robin.—General considerations on the Crustacean fauna of great depths in the Carribbean Sea and the Gulf of Mexico, by M. Alph. Milne-Edwards. This deals with some results of the cruises in the *Blake*. Many new Crustacean species were obtained, and certain groups previously thought foreign to American waters were found abundantly at great depths. Anomouran and macrouran Crustacea there abound. Numerous forms intermediate between groups that have been thought very distinct are discovered (and the author cites several examples).—New clinical researches tending to prove that the cerebellum

is the co-ordinating nerve-centre for movements necessary to standing and walking, considered in all their forms, by M. Bouillaud.—On the systems of faults or diaclases which traverse the series of stratified formations; new examples furnished by Cretaceous strata in the environs of Etretat and Dieppe, by M. Daubrée.—On Fuchsian functions, by M. Poincaré.—A letter of Ampère was presented.—On a class of Abelian integrals and on certain differential equations, by M. Picard.—On an integrator, or instrument for graphic integration, by M. Abdank-Abakanowicz.—On the cooling power of gases and vapours, by M. Witz. He infers equality of the cooling powers of dry air and air saturated with moisture. The cooling power of coal-gas compared with that of air is equal to 3·48, that of sulphurous acid does not exceed 0·61 (the pressure being 760 mm.). The velocities of cooling increase more quickly than the 1·233 power of the excesses. For steam they increase proportionally to the 0·83 power.—On the surfaces of revolution limiting liquids deprived of weight, by M. Terquem.—On radiophony: third note by M. Mercadier. He proves that the radiophonic effects are due to vibratory motion caused by alternate heating and cooling through intermittent radiations, principally in the gaseous layer adherent to the solid wall struck by these radiations; the anterior wall in opaque receivers, the posterior in transparent receivers.—Magic mirrors of silvered glass, by M. Laurent. He uses either pressed glass (polishing the surface opposite to the projections), or thin glass of commerce (engraving a hollow design on it).—On pyridic bases, by M. de Coninck.—On the hystolysis of the muscles of larva during the post-embryonic development of Diptera, by M. Viallanes. This relates to the phenomena of disappearance of muscles as the insect passes into the state of *pupa*.—On a new larva of Cestoïdes belonging to the type of the Cysticercus of Arion, by M. Villot.—On a new form of segmentary organ in Trematodes, by M. Macé.—Researches on the circulation and respiration of Ophiures, by M. Apostolidès. The circulatory system is formed of the general cavity and the spaces connected with it; and the respiratory sacs, by their alternate contraction and expansion, draw the blood into the peristomachal cavity, then drive it to the periphery. This explains how the sanguineous liquid, bathing all the organs, respires, and is set in motion.—On a method of coloration of Infusoria and anatomical elements during life, by M. Certes. Placed in a weak solution of chinoline blue, or cyanine, Infusoria take a pale blue colour, and may continue to live twenty-four to thirty-six hours. After twenty-four hours in a moist chamber, the white corpuscles of a frog's blood, coloured with cyanine (in serous solution) show amœboid movements. Chinoline blue is, *par excellence*, the reagent of fatty matter (which is quite absent in nuclei and nucleoli).—On the permanence of prussic acid during a month in the bodies of animals poisoned with this substance pure, by M. Brame. A rabbit and a cat were poisoned with 1 gramme of the substance each. In such dose it seems to preserve the animals perfectly at least a month, remaining in the tissues (especially those of the stomach), with which it seems to become intimately united.

February 28.—M. Wurtz in the chair.—The following papers were read:—On the attenuation of virus and its return to virulence, by MM. Pasteur, Chamberland, and Roux. The bacterium of *charbon* in artificial cultivation produces true germs (unlike the microbe of chicken cholera, which multiplies by division), whose virulence is not affected by air. This spore-production can be hindered by cultivation at 16° or at 42° to 43°. The mycelian product, in the latter case, becomes sterile after about a month; up to that point reproduction is easy, but the virulence is gone after the first eight days, in which time it passes through various stages of attenuation. The secret of causing a return of virulence consists in successive cultivation in the bodies of certain animals. The facts throw light on the etiology of epidemics.—Action of hydracids on halogen salts containing the same element, by M. Berthelot. Compounds so formed exist both in the case of alkaline salts, where they are denoted by absorption of gas, liberation of heat, and special reactions, and in the case of metallic salts properly so called, where they are obtained crystallised.—M. de Lesseps presented a fifth series of documents relating to the history of the Suez Canal.—On the disinfectant and anti-putrid action of vapours of nitrous ether, by M. Peyrusson. Its action is shown both from laboratory and hospital observations. It has the advantage of an agreeable and harmless smell.—On a new definition of the surface of waves, by M. Darboux.—On the development of the infinite product $(1-x)$, $(1-x^2)$ $(1-x^3)$ $(1-x^4)$ . . . by Mr. Franklin.—On radiophony, by M. Mercadier. He makes *thermophon*[illegible] or *phonic thermomultipliers* (after the analogy of electric [illegible] multipliers), for study of radiant heat, a single element consisting of a short glass tube containing a thin plate of smoked [illegible] mica, and several such being connected by caoutchouc or [illegible] tubes. The air in these tubes vibrates longitudinally, and lengthening them he gets *thermosonorous* pipes, having the same properties as ordinary sounding-pipes.—Application of Talbot fringes to determination of the refractive indices of liquids, by M. Hurion.—On the displacement of the soda of chlorate of sodium by hydrate of copper, by M. Tommasi. This takes place even at a low temperature (4° to 5°). With pure sodium chlorate the reaction is almost instantaneous. Potassium chlorate gives like results.—On the heats of combustion of some alcohols of the allylic series and of aldehydes which are isomeric with them, by M. Louguinine.—On the products of decomposition of proteic matters, by M. Blennard.—On a synthetic homologue of [illegible] letierine, by M. Étard.—On a cause of alteration of canvas, by M. Balland. This relates to an observation by Dr. Tripier on some rusty-coloured hammock canvas used by the Algerian army in 1847. This showed dark spots after washing, and were [illegible] pieces in use. The spots were probably due to iron salts produced by alkaline sulphides in the artificial soda and by the oxide fixed by the stuff in manufacture. The sulphide passes to the state of sulphate in air by a combustion involving [illegible] tissue.—Contribution to the study of trichinosis, by M. Chatin.—Contribution to the physiological action of [illegible] of ammoniacal salts, by MM. Richet and Moutard-Martin. *Inter alia*, it is singular that injection of a concentrated solution of urea increases the elimination of water more than of urea. The uremia death cannot be attributed to non-elimination of the ammoniacal salts of urine.—On the inflammatory nature of the lesions produced by the poison of the Bothrops serpent, by M. Couty and De Lacerda.—On the pulmonary alterations produced by long stay in the purifying chambers of gas-works, by M. Poincaré. Animals kept eight months in those chambers exhibit in the lungs an accumulation of epithelial cells in some alveoli, but especially a prodigious nuclear proliferation in the connective tissue. This shows that it is not without danger to send children with whooping-cough to similar treatment.—Retina of the cylinder axis and the peripheral nerve-cells with rods of sense in insects, by MM. Künckel and Gazagnaire. In man every nervous enlargement consists essentially of a bipolar cell (true nerve-termination), connected on one hand with the cylinder axis of the nerve-fibre, and on the other with a nerve-rod which is its prolongation; this rod is surmounted by a cone, properly so called, or a transformed hair.—On the genus [illegible] of Pyrosoma, by M. Joliet.—Antiquity of *Elephas primigenius* (Blum) in the sub-Pyrenean Valley, by M. Caraven-Cachin. It seems to have appeared first after the diluvium of the plain, on the old Pleistocene spread in a nearly horizontal sheet of Tertiary and other strata.

LIGHTNING CONDUCTORS.

Experience, accumulated since the time of Benjamin Franklin, proves conclusively that a Conductor made of Copper of adequate size is the best of all appliances for the protection of every description of building from the destructive effects of lightning.

NEWALL & CO.'S

PATENT COPPER LIGHTNING CONDUCTOR,

As applied to all kinds of Buildings and Shipping in all parts of the world with unvarying success; is the most Trustworthy, most Effective, and also the Cheapest Conductor ever offered to the public.

It is simple in its application, no insulators being required, and it costs only one shilling per foot for the standard size, which ensures safety in any storm.

THROUGH THE RANKS TO A COMMISSION. Crown 8vo. 6s.

This volume records the experiences of an aspirant to a military career, who, being too old to obtain a commission by the road of Examination, made up his mind to win it by working his way up through the ranks. He succeeded in the unprecedented short period of fifteen months. No one has hitherto had such an opportunity of describing the daily life of our soldiers from inside. As it bears no author's name, the Publishers feel bound to state that they have seen documents and letters from various persons which leave no doubt in their minds as to the authenticity of the narrative.

"This very interesting and indeed instructive narrative . . . is exceptionally interesting."—*Army and Navy Gazette.*

SOLAR PHYSICS.

The following COURSE of LECTURES will be given by Members of the Committee on SOLAR PHYSICS, appointed by the Lords of the Committee of Council on Education:—

An Introductory Lecture. By Prof. STOKES, Sec.R.S. 6th April, 1881.

A Lecture on the Practical Importance of Studying the Influence of the Sun on Terrestrial Phenomena. By Lieut.-General STRACHEY, R.E., C.S.I., F.R.S. 8th April.

Two Lectures on the Connection between Solar and Terrestrial Phenomena. By Prof. BALFOUR STEWART, F.R.S. 27th and 29th April.

Six Lectures on Spectroscopy in Relation to Solar Chemistry. By Mr. J. NORMAN LOCKYER, F.R.S. 4th, 6th, 11th, 13th, 18th, and 20th May.

Three Lectures on the Photography of the Infra-red of the Spectrum in its Application to Solar Physics. By Capt. ABNEY, R.E., F.R.S. 25th and 27th May, and 1st June.

The LECTURES will be delivered in the Lecture Theatre of the South Kensington Museum at 4 p.m. on the days stated above.

Admission will be by Tickets, which may be obtained, as far as there is room, on application by Letter to the SECRETARY, Science and Art Department, South Kensington, S.W.

SOCIETY FOR THE ADVANCEMENT OF CHEMICAL INDUSTRY.

A Meeting for the purpose of forming a Society for the Advancement of Chemical Industry will be held on MONDAY, April 4th, 1881, in the rooms of the Chemical Society, Burlington House, Piccadilly, London, W., at 4 p.m.

Prof. ROSCOE, F.R.S., President of the Chemical Society, will occupy the chair.

All persons interested in the Chemical Industries are hereby invited to attend.

GEORGE E. DAVIS, Hon. Sec. *pro tem.*

THE ENDOWMENT OF RESEARCH.

The ASTRONOMER-ROYAL, in a Letter of much import addressed by him to Captain W. NOBLE on the 10th inst., wrote as follows:—

"The very utmost, in my opinion, to which the State should be expected to contribute is exhibited in the large Grants entrusted to the Royal Society. The world, I think, is not unanimous in believing that THEY have been useful."

"THE PROCEEDINGS" and "THE PHILOSOPHICAL TRANSACTIONS OF THE ROYAL SOCIETY" contain many elaborate Papers with details of painful Experiments upon Animals for Scientific Purposes. These practices extend over a long series of years down to the present generation. They are as much wanting in real Humanity and true Wisdom as, perhaps, they ever were. Which is asserting much, for two great Surgeons of distinguished ability and learning have said of the ROYAL SOCIETY:—"Their old and favourite experiment, so often repeated by Hooke, Croone, and others, before our ROYAL SOCIETY, viz., of blowing up the lungs of a Dog, and then compressing them, is good for nothing."

"Hujusmodi doctrinas bene adumbravit fabula
de Ixione; qui cum Junonis, potentiæ deæ,
concubitum animo sibi designaret, cum
evanida nube rem habuit; ex qua Centauros
et Chimæras progenuit."

FRANCISCI BARONIS DE VERULAMIO.

SOCIETY for the TOTAL ABOLITION and UTTER SUPPRESSION of VIVISECTION.

Honorary Secretary and Treasurer,
GEORGE R. JESSE, Esq.,
Henbury, near Macclesfield, Cheshire.

February, 1881.

SILVERED GLASS SPECULA.

JOHN BROWNING begs respectfully to inform the scientific public that he can supply Specula from 3½ in. to 18 in. diameter, of Mr. With's parabolising. The stock is composed of the choicest reserves of the last ten years of Mr. With's productions, and Mr. With's Specula are generally admitted to be the finest ever made.

Each Mirror bears Mr. With's signature.

A reduced Price List of Specula, Mounted or Unmounted, will be forwarded post free.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist

SOUND: ELEMENTARY LESSONS ON.

By Dr. W. H. STONE, Lecturer on Physics at St. Thomas's Hospital. With numerous Illustrations.

"This is an excellent little text-book, well adapted for students of the Science and Art Classes, but also of considerable value to those who desire to do something more than cram. The student of acoustics will find it a very acceptable help, and a stepping-stone to the more elaborate works on the subject, while the musician will find in its pages information which may be of great assistance to him in the acquisition of his art."—*English Mechanic*.

NEW WORK BY LIONEL S. BEALE.

Now ready, pp. 230, demy 8vo, 5s.

SLIGHT AILMENTS:

THEIR NATURE AND TREATMENT.

By LIONEL S. BEALE, M.B., F.R.S., F.R.C.P.

Professor of the Principles and Practice of Medicine in King's College, London.

J. & A. CHURCHILL, New Burlington Street.

New Edition, very much enlarged, 21s.

HOW TO WORK WITH THE MICROSCOPE.

By LIONEL S. BEALE, F.R.S.,

President of the Royal Microscopical Society.

THE FIFTH EDITION,

Strongly bound and enlarged to 530 Pages, with 100 Plates, some of which are Coloured, is now ready.

HARRISON & SONS, Pall Mall.

Price £1 1s.

PHILOSOPHICAL TRANSACTIONS.

The FELLOWS of the ROYAL SOCIETY are hereby informed that the Third Part of the PHILOSOPHICAL TRANSACTIONS, Vol. for the year 1880, is now published, and ready for delivery on application at the Office of the Society in Burlington House, daily, between the hours and 4.

Burlington House. WALTER WHITE, Assistant Secretary. R.S.

Just Published, price 2s. 6d.

An ELEMENTARY COURSE of PRACTICAL PHYSICS. By A. M. WORTHINGTON, M.A., F.R.A.S. Assistant Master at Clifton College.

RIVINGTONS, Waterloo Place, Pall Mall, London.

CHEMISTRY: a TREATISE ON. By Prof. ROSCOE, F.R.S., and Prof. SCHORLEMMER, F.R.S., of Victoria University, Owens College, Manchester. With Illustrations, &c. Vols. I. and II. Inorganic Chemistry.

Vol. I. The NON-METALLIC ELEMENTS. 18s.
Vol. II. Part 1.—METALS. 18s.
Vol. II. Part 2.—METALS. 18s.
Vol. III. ORGANIC CHEMISTRY. [*In the press.*

"It would be difficult to praise this most valuable Manual too highly. . . . . The arrangement is clear and scientific; the facts gained by modern research are fairly represented and judiciously selected, and the style throughout is singularly lucid."—*Lancet.*

"A most valuable contribution to the literature of chemistry . . . . . The work when finished will afford the most complete systematic exposition of the existing state of chemical science that has yet appeared in the English language."—*Nature.*

By Prof. ROSCOE, F.R.S.

LESSONS IN ELEMENTARY CHEMISTRY; Inorganic and Organic. With numerous Illustrations. New Edition. Fcap. 8vo. 4s. 6d.

PRIMER OF CHEMISTRY. With Illustrations. 18mo. 1s.

By Prof. SCHORLEMMER, F.R.S.

THE CHEMISTRY OF THE CARBON COMPOUNDS; or, Organic Chemistry. With Illustrations. 8vo. 14s.

"Must prove eminently useful to the chemical student."—*Athenæum.*

MACMILLAN AND CO., London.

GEOLOGY AND MINERALOGY.

IN the Preface to the "Student's Elements of Geology" by Lyell he says, "As it is impossible to enable the reader to recognise rocks and minerals at sight by aid of verbal descriptions or figures, he will do well to obtain a well-arranged collection of specimens." These can be had from BRYCE WRIGHT, MINERALOGIST, 90, Great Russell Street, W.C.

MACQUORN RANKINE'S SCIENTIFIC PAPERS

Miscellaneous Scientific Papers by W. J. Macquorn Rankine, C.E., LL.D., F.R.S., late Regius Professor of Civil Engineering and Mechanics in the University of Glasgow. From the Transactions and Proceedings of the Royal and other Scientific and Philosophical Societies and the Scientific Journals. With a Memoir of the Author by P. G. Tait, M.A., Professor of Natural Philosophy in the University of Edinburgh. Edited by W. J. Millar, C.E., Secretary to the Institute of Shipbuilders in Scotland. With Portrait, Plates, and Diagrams. (London : Charles Griffin and Co., 1881.)

THE volume before us contains thirty-seven papers of rare scientific interest written by the late Prof. Rankine, who died now eight years ago. As to the cause of this long interval the Editor gives us no hint, nor is there anything in the volume to explain it. All the papers are reprints, without note or comment, except such as is contained in the concise but extremely graceful Memoir. These papers are not by any means all Rankine's original works. They are principally those relating to Thermodynamics and Hydrodynamics. There are however two important papers on the latter subject which are not contained in the volume ("On Stream Lines," *Philosophical Magazine*, 1865; "On the Mathecal Theory of Stream Lines," *Phil. Trans.* Royal Society, 1871). These can hardly have been omitted by design, as in the very last paper contained in the volume the author resumes the subject, directing attention to his paper of 1865, while the paper of 1871 is the most general and important paper Rankine wrote on this subject, besides being his last work.

The first twenty-seven papers contain the development by Rankine of that most modern of mathematical sciences, Thermodynamics, from its foundation-stone to the complete edifice as it exists at the present day. This by no means constitutes Rankine's entire work, nor do we think it his most useful work. But it is the largest gem in the casket, and should he be forgotten in all the rest this alone will secure for him a foremost place amongst those who have left their mark on philosophy.

The rapidity of the development of this branch of science is unrivalled. As profound as anything ever brought to light by the power of reason, it only occupied Rankine four years from the publication of his first paper until the theory was completed and applied to all cases. That the burning of coal was necessary to the production of steam, which was necessary for the working of an engine, and that the proportion of coal burnt bore some relation to the work done, were facts which for 200 years had been forcing themselves into notice, and gradually there had come to be an idea that in some way heat was the same thing as other forms of mechanical energy. But this was all, till, in 1843, Dr. Joule published his first experimental determination of the mechanical equivalent of heat. Published in an obscure way, it was some years before this novel but definite relation between heat and energy excited notice. The first published notice is by Thomson in 1849, although that Rankine had known it for some time previously is shown by the first of these papers, published in July of that year. In December of the same year Rankine sent in the Papers III. and XIV.,[1] containing the elements and some applications of his theory, and in 1854 he had published the complete theory and its applications to various engines, making instant use of the splendid experimental results just then obtained by Regnault. From this time it has been as possible definitely to forecast the result to be expected from any kind of engine as from 1690 to predict the behaviour of the moon.

From a philosophical point of view, there was a keen race in discovery between Thomson, Rankine, and Clausius, a race in which Thomson had the start, but which was neck and neck between Rankine and Clausius. But from the practical point of view Rankine was alone. And in this respect these papers, as indeed all his others, have a value both intrinsic and as examples of method which even transcends their philosophical value.

It was Rankine's practical knowledge which gave him his great advantage, but he had in some respects an advantage in having based his theory by means of an hypothesis on the fundamental laws of motion. Rankine worked from an hypothesis of his own creation as to the molecular constitution of matter, which was perfectly definite and capable of including all the phenomena which he had to consider. The definiteness of his hypotheses gave that definite form to his formula which suggested many points otherwise overlooked.

But as often happens, the definiteness of his hypotheses was also his source of weakness ; he assumed the atoms of matter to be masses of fluid subject to eddies and vibrations, but otherwise at rest. This suited the conditions of his problem, but it was only an hypothesis, and as it was definite, so any phenomenon with which it was incompatible sufficed to disprove the hypothesis and bring down the edifice raised upon it. And such phenomena, those of diffusion, existed ; although they did not come within the range of his work.

Rankine was himself fully alive to his position, and having once obtained his ideas and framed his formulæ, took and acknowledged a hint from his contemporaries, Thomson and Clausius ; and having shown that Carnot's theorem, which they had modified and made the basis of their reasoning, was a consequence of his molecular vortices, he adopted a general law as the base of his reasoning, and cut himself off from his hypotheses. This was easy for him to do, for, as may be seen in § 15*a* of Paper III., he had with no small care framed his hypotheses so as to fit the same law, though expressed in other words. This article is also interesting as showing the unlimited faith he must have reposed in the design and care of Providence. Not only does he conceive each atom of matter to possess a fluid atmosphere, in which exist a number of similar cyclones or eddies, symmetrically placed all over the atom, but he required that wherever two atoms touched there two eddies should face, and so exactly as to be coaxial. Many complicated properties were attributed by Newton and others to the corpuscles of light, but such a demand as is here implied on the attention of Providence has probably never been equalled

[1] Why this paper is placed so far out of its chronological order does not appear.

—a whole crew of Maxwell's demons on each atom would be required to warp and moor for every movement that might occur. But so true was Rankine's knowledge of mechanics that all this elaborate refinement did not prevent his hypothesis leading him to correct results.

This refined organisation, however, which renders his hypothesis in the highest degree improbable, suggests a most important consideration. For the almost infinite complexity of his particular arrangement indicates almost to the extent of a proof that the results he obtained must depend upon circumstances so general as to be independent of any particular hypothesis, so long as it is in conformity with the laws of motion, and hence the trail of these general circumstances is crossed.

In Rankine's hypothesis the temperature comes out as a direct measure in any particular substance of the kinetic or actual energy of the molecular motion. This conclusion, to which he adhered in the final foundation of his theory, is general, but it does not appear to be the most general conclusion of which our present experiments admit. It led Rankine to give a definite form as well as name to his thermodynamic function, which forms the fundamental equation of all the mathematical work. But it was subsequently shown that the differential equation to the same lines could be obtained without the assumption with regard to temperature, and then it did not appear that there was sufficient experimental data for the complete determination of the constants which enter into the integral. This is owing to the hitherto impossibility of determining the exact form of the adiabatic curve for solids and liquids. With gases it is different, and with these Rankine's law is found to fit, but so might a law framed on the supposition that in other cases the kinetic energy was some other function of the temperature. What is proved therefore is not that the temperature is a direct measure of the kinetic energy, but that this is some function of the temperature. This is apparently all that has yet been accomplished, so that Rankine's definite conclusion must be looked upon as suggested rather than proved by experiment. There can be no doubt however that this definiteness led to a vast development of the subject, and hence it was no mere fancy or partiality for his own view which led him to adhere to that form of second law which included his earlier view. Nor will the study of Rankine's earlier papers be time wasted on the part of those who seek to understand this extremely difficult subject. They will there find a model of the machinery by which the general result might be obtained, and if, as is the case with most new inventions, the machinery is unnecessarily complex, it is still the only machine which has accomplished the results.

They will also find, what must for ever add an interest to these papers, the first use of the terms thermodynamic function, adiabatic curve, potential energy, and others now in general use; for Rankine's nomenclature, to a great extent his notation, and entirely his graphic method, have been universally adopted.

Rankine's methods have been called "uncouth," "diffuse and obscure," and without doubt they must seem all this to those who come to the subject with all the latest inventions in the form of mathematical machine tools in perfect working order,—just as the axe or adze must seem barbarous when there is a planing machine at hand to do the work, and the material has been prepare for it. But let the shape required be of a novel kind, let the material be in the rough, and then how does fare with the planing machine?

Like that of Green, the whole career of Rankine is a rebuke to those who would exhaust the finest material this earth—the best brain of our youth—converting into elaborate mechanism only adapted to reduce, however elegant a manner, already prepared billets elegant and improved copies of masterpieces which having once been shaped, although roughly with prim tools, can never have to be shaped again. The mate at last existed for a great mathematical edifice, of wh the want had long been felt, and our great mathema workshop was crowded with the most refined mecha rusting for want of material to work upon. Bu material was in the rough, and while waiting for so one to strip off the bark the chance was lost, fo obscure, self-taught mechanic who set to work wit and adze did not stop at the bark, but with rapid and w directed strokes brought out the form divine. How uncouth Rankine's methods may be, they have the g merit that they require nothing but a bold fron result being obtained without adventitious aid. T are inscrutable to those who, having learnt the rela between quantities as expressed by symbols, have gotten if they ever knew the purpose of their for But to the reader who thinks Rankine's methods a statement of his thoughts, and though often a ha task, any one who succeeds in understanding Ran finds to his satisfaction that he has done more than that he understands what Rankine understood.

Nor is this true only of his great work. What see to us his most useful work is that of showing h the elementary mathematical methods were sufficie adaptable to be applied to almost all cases of practi mechanics. The results are only approximate; but when neither the data nor the desired result can be exa measured, this is all that could be obtained, were methods never so exact. One might as well set bra by Sir Joseph Whitworth's millionth-of-an-inch machi as use the exact equation of thermodynamics to det mine the probable work to be obtained from a steam engine.

The graphic method was Rankine's great weapo This, which is probably as old as any mathemati method, had been long neglected, except that it w sometimes used for engineering purposes. Rankine ear perceived its applicability to the subjects he had to teach and in his treatises on Applied Mechanics, Shipbuildin and the Steam-Engine there are many instances of novel and useful application which have been copied in and wide, while his graphic treatment of the subject thermodynamics has been universally adopted. But the height of his achievement in the application and develop ment of the graphic method is only reached in his papers on the motion of fluids.

These papers, with the omission already noticed, are collected at the end of the volume, and they constitute by no means its least valuable part. They are *comparatively* his later work. The first, "On the Exact Form of Waves at the Surface of Deep Water," was published in 186 after his thermodynamical work was essentially complete

Both the method and matter of this paper are unique. e results are obtained by a simple geometrical study rolling circles. And there for the first time definite soning is adapted to the actual proportions of deep- waves, all previous work on the subject having been sed on the assumption that the height of the wave is all compared with its length.

It is however in the next paper that he first shows what ıy be done by Maxwell's method of the graphic use of nilies of surfaces or curves. Here we have what is visible in the fluid itself and had only been expressed complex algebraical formulæ—the internal motion of e fluid—shown in such a way that not only the direction ıt the magnitude of the motion at every point may be ken in at a glance as well as definitely measured, and l deduced by simple but rigorous geometrical methods. he credit of this, which is certainly one of the highest hievements in the art of expression, must be divided. was Faraday who first conceived the force of a magnet pressed by a family of lines; and it was Maxwell who iscovered the rigorous method of drawing Faraday's nes; while Rankine realised in this the means of apply- ıg and expressing the principles of the steady flow of ıids propounded by Stokes now forty years ago.

In these papers on Hydrodynamics, as in all his other ork, Rankine had a practical purpose in view. In this ıse it was the skin resistance and wave resistance of ıips. And if, owing to the neglect of friction in the ındamental equations of motion, some of the results are ill doubtful, yet in this respect the work is on a par ith all the rest that has been done on this subject. And ıese papers, owing to the clear conception they convey f the internal motions of fluid and the direct purpose of ıe means adopted to elucidate these, afford by far the est chance for any one wishing to pursue the subject up) the highest position it has at present attained.

That Rankine himself owed much to having early irected his thoughts to fluid motion appears in all his work, s well as being shown by his theory of molecular vortices —a strictly hydrodynamical conception—amongst the in- ricacies of which nothing but his exact knowledge of the ubject could have kept him straight.

It must be remembered however by those who would nake a like use of such knowledge that Rankine did not egin his career by the study of mathematics; but that ıs an engineer from his birth, as we are told in the Memoir, he first became aware of the circumstances and problems of mechanics, and only evolved or acquired his mathematics as he found them necessary to his work. In this way his knowledge of mathematics must have included the knowledge of the necessity for each step. It was necessity first, and then method or invention; and not, as is too often the case with those who begin to learn mathematics before they are aware of what it is they are to do, all means and no ends.

In Rankine's text-books, as in his original papers, the ends are always kept in view. It is often impossible for others to follow him unless they begin by actually mastering the circumstances of the problem and trying to solve it for themselves, then if they honestly fail they will find that Rankine will help them; while if they succeed they will find that Rankine was before them. These books, both as regards originality of matter and the attention paid to the circumstances of each problem, have more the character of original papers than orthodox text-books. From this as well as his other writings it is clear that he acquired his knowledge of mathematics from the original works of the master, and not from text-books.

His example should therefore be the best recommendation for all those who would really understand mechanics to read the works direct from the hand of this master—a task which, with the aid of this volume, they may now accomplish without that trouble of search which, small as it is, leaves many a masterpiece on the shelf in some dark corner, while a mutilated and garbled extract disgusts the reader and discredits the thinker.

OSBORNE REYNOLDS

THE FERNS OF NORTH AMERICA

The Ferns of North America; Coloured Figures and Descriptions, with Synonymy and Geographical Distribution, of the Ferns of the United States of North America and British North American Possessions. By D. C. Eaton, Professor of Botany in Yale College. The Drawings by J. H. Emerton and C. E. Faxon. 2 Vols. quarto, pp. 352 and 285; 81 Plates. (Boston: S. E. Cassino, 1880.)

THIS handsome work, which has been brought out in parts, issued about one every two months, beginning with 1878, is now completed. Although ferns have long been popular in the United States, both with collectors and cultivators, this is the first large illustrated monograph of the indigenous species which has been attempted. For our own country we have several, of which the best known are Hooker's "British Ferns," with coloured figures, in large octavo; Lindley and Moore's "Nature Printed Ferns," in more than one edition; and Newman's "British Ferns," in which the plates are uncoloured woodcuts; but of the American ferns there are but few figures, and those widely scattered in general works, and even leaving figures out of the question there has been no descriptive handbook specially devoted to them, so that those who wanted to work at the subject have been placed at a great disadvantage. Prof. Eaton, who is the grandson of a well-known botanical author, has been universally recognised for the last twenty years as the leading authority on the subject. He has a large library and general collection of his own, has visited Europe and studied the American ferns in the public herbaria of the Old World, has proved himself in other departments of botany to be a careful and judicious systematist, and he is a teacher of botany of many years' experience, and has been looked up to for a long time by all the collectors of ferns throughout the Union as their referee in cases of doubt and difficulty; so that he has had every advantage for dealing with his subject in a thorough and exhaustive manner, and as he has been ably seconded by his two artists, the result is a monograph which is thoroughly satisfactory in every way, and which will be universally accepted both at home and in Europe as a standard work.

The geographical area which it covers is the whole of the American continent, from the Pole to the southern boundary of the United States. The true ferns only are included, not the Lycopodiaceæ, Equisetaceæ, and Rhizocarps, which are monographed along with the ferns by

Hooker, Milde, and in the earlier editions of Newman. In North America the order is represented by 139 species and 31 genera. The number of species is quite double what we have in the whole of Europe. The northern area outside the United States produces very few species that have not been found within the bounds of the Union. As in Europe there are no Cyatheaceæ, Marattiaceæ, nor Gleicheniaceæ. Of the other sub-orders the Schizœaceæ, which we do not possess, are represented in the United States by three genera and four species. Ceratopteris, of which Prof. Eaton makes a special sub-order, is also American, but not European. The other four sub-orders—Polypodiaceæ, Hymenophyllaceæ, Osmundaceæ, and Ophioglossaceæ—are represented, both in America and Europe. One peculiarity of ferns is that the genera show exceedingly little tendency to geographical localisation. The nearest approach to this that we have in North America is the predominance of Pellæa, Cheilanthes, and Nothochlæna, which are allied dwarf types with a greater power of resisting drought than any other set of ferns, and which are represented in this area by a large proportionate number of endemic species. These three genera take up thirty-nine species in North America against four for Europe. Out of the 139 species about forty are endemic, and about forty are European, the latter including several of our high mountain types, such as *Cystopteris montana*, *Aspidium Lonchitis*, *Polypodium alpestre*, *Woodsia ilvensis*, *glabella*, and *hyperborea*. The southern boundary of the States corresponds broadly with the limit in a northern direction of the great tropical flora of Equatorial America, the richest tropical flora in the world. But out of the 139 ferns at least twenty are characteristically widely-spread tropical species which do not extend beyond Florida, which have several of them only been discovered there within the last few years. Such are *Ophioglossum palmatum*, *Acrostichum aureum*, *Polypodium aureum*, *P. Phyllitidis*, *P. Plumula*, and *P. pectinatum*, *Vittaria lineata*, and *Nephrolepis exaltata*. Amongst the remaining species there are some curious cases of a *rôle* of distribution it is difficult to explain or understand. *Adiantum pedatum* and *Osmunda cinnamomea* are examples in ferns of a considerable group of American plants which reach Asia by way of Japan and run down through China to the Eastern and Central Himalayas; *Pteris serrulata*, found lately in America in Alabama, and South Carolina, reappears only in China; *Pellæa andromedæfolia*, which from California passes down the Andes to Chili, reappears in Cape Colony. *Nothochlæna tenera* is supposed to be divided between Southern Utah and the Andes of Bolivia and Chili, but here I think that the States plant will most likely have to rank as a distinct species. *Aspidium mohrioides*, long supposed to be endemic in extra-tropical South America, has been discovered lately by Mr. Moseley in Marion Island, and by Mr. Lemmon in one place at an elevation of 8000 feet above sea-level amongst the mountains of California.

As regards the limitation of genera and species Prof. Eaton differs but little from Sir William Hooker, as the English author's views are expounded in his great monograph of the ferns of the whole world, his "Species Filicum." Prof. Eaton treats Hymenophyllaceæ and Ceratopteridæ as distinct sub-orders; the former at any rate a decided improvement upon Sir W. Hooker's cla... sification, and he maintains Ophioglossaceæ as a distin... order. In genera the principal deviations are that ... keeps up Phegopteris as distinct from Polypodium, ... merges Nephrodium in Aspidium.

A very curious North American fern is *Asplen... ebenoides* of Scott. It is very rare, and always grow... company with the walking leaf (*Camptosorus rhi... phyllus*) and *Asplenium ebeneum*, two common Ameri... species. These are very dissimilar plants, but ... *ebenoides* is quite intermediate between them. Pr... Eaton seems not disinclined to the idea that it may ... produced by natural hybridisation, as was suggested ... the Rev. M. J. Berkeley in the *Journal* of the Roy... Horticultural Society for 1866, p. 87.

An observation of Prof. Eaton's under *Nothochl... Fenaleri* is interesting as bearing upon Milde's cla... fication of ferns into a catadromous and anadrom... series, according as to whether their lowest second... branches originate on the posterior or anterior si... the pinnæ. Prof. Eaton notes that in this species ... is always a decided inequality in their origin; but ... it is sometimes on the anadromous, and at others on ... catadromous plan.

J. G. Baker

KÖLLIKER ON ANIMAL DEVELOPMENT

Grundriss der Entwickelungsgeschichte des Menschen ... der höheren Thiere. Von Albert Kölliker, Professor ... Anatomie an der Universität Würzburg. (Leipzig: ... Engelmann, 1880.)

THIS book is essentially a reproduction of ... Kölliker's large treatise on Embryology, with a ... part of the detail and controversial matter omitted, ... intended for the use of medical students. The ... work has more the character of a monograph on ... development of birds and mammals than of a text-... and as such, though of very great value to those engag... in teaching and research, is necessarily too bulky ... use of ordinary students. We think, therefore, that ... Kölliker has done very wisely in publishing the ... before us; and we need hardly say that, his larger ... having been already universally recognised as one of ... most important contributions to embryology during ... years, the present work may safely be regarded as ... accurate statement of the facts of avian and mammal... embryology. We may add that no trouble has ... spared in the illustrations, which fully come up to ... high standard characteristic of German works of ... class.

While, however, we can say this much in praise ... Prof. Kölliker's treatise, we cannot help recognising ... it has some rather serious defects. Prof. Kölliker is ... extremely objective writer. He describes with great ... clearness the objects as they present themselves to ... observer, but he scarcely ever attempts to connect ... together or to point out the general principles which ... underlie the mass of detail with which he has to deal. ... In his larger work this peculiarity is of comparatively ... small importance, in that those who are likely to use ... are able to supply the general principles for themselves, ... and the work has already become a great mine of fact ... to which every anatomist who is engaged in studying the ... morphology of vertebrates will necessarily turn.

In a book however intended for medical students, it is, in our opinion at least, of the utmost importance that the facts of embryology should not merely be stated in succession, but that their significance should be pointed out. Embryology is of but little practical value to a medical student, and the small amount he must necessarily know could be given in a very few pages, and is, we believe, usually to be found in works on human anatomy. Considered however as an educational instrument, embryology is of the utmost value. It gives to the student an insight into the meaning of the structures which he meets with in his dissections, and by so doing often renders details of anatomical structure comparatively easy and pleasant of acquisition, which would otherwise be a great and almost repulsive strain on the memory.

Embryology should be taught to the medical student as a comparative science; with the facts duly marshalled, their significance pointed out, and general principles deduced from them. In such a form it ought to constitute an important part of medical training, which every medical school of any pretence to excellence should impart to its students.

We would venture to call attention to the following instances as illustrative of what we consider the unsatisfactory treatment of certain parts of the subject to be found in Prof. Kölliker's work. In dealing with the phenomena of segmentation Prof. Kölliker makes no effort to point out that the differences in the early development of the mammal and bird are in the main the result of the presence of food yolk in the one case and its absence in the other. After reading his very careful and elaborate treatment of the primitive streak, the student would, we think, be left in complete ignorance of the real significance of this interesting structure.

Again, in his account of the placenta, which he describes in man and the rabbit, he has so little to say as to any comparison between the two that we are at a complete loss to understand why he should have made any mention of the former.

In his account of the development of the vascular and excretory systems we are struck with the almost entire lack of any attempt to put the facts which have been so admirably described to their legitimate use, viz. to the explanation of the arrangement of these and other structures in the human body, and of the presence of rudimentary organs.

In making these strictures on Prof. Kölliker's work we should be sorry to convey the impression that we underestimate the value of this in most respects admirable treatise. It has already become justly popular in Germany, and we trust that it will also become widely known in this country.

OUR BOOK SHELF

Bulletin of the United States Geological and Geographical Survey of the Territories, 1879-80. Vol. v. (Washington, 1880.)

THE publications issued by the American Government under the above title are so appreciated in this country that it seems unnecessary to compliment Dr. Hayden and his coadjutors on the appearance of another of their useful volumes. During the last few years, however, there have been brought out by the U.S. Department of the [illegible] some works by Dr. Elliot Coues, which for patient industry must compare with any that have ever been compiled in scientific literature. The title of the volume now before us reads as follows:—Art. 26. Third Instalment of American Ornithological Bibliography, by Dr. Elliot Coues, U.S.A., and consists of 545 octavo pages of small print. How many titles of papers and books are quoted in this laborious treatise we should be sorry to have to count. The labour must have been enormous, and it is only those who have to follow the intricate windings of synonymic literature who can appreciate the work here performed by Dr. Coues. We learn that we may expect at some future time a similar conspectus of titles relating to the ornithology of the Old World, but although the present volume professedly deals with American Birds only, many standard works of general interest are passed in review by the author, who exhibits great judgment as a critic. Taking Gray's "Hand-List of Birds" as a basis of classification to follow, Dr. Coues treats of each family separately, and then in chronological order he records every work, every paper, and every note which directly or indirectly affects the American species, and as regards each year the publications are separately entered under the authors' names in alphabetical order. We must however again warn ornithologists that so many collateral references are given to Old World papers where the families are at all cosmopolitan, that therefore no one writing on any group of birds can afford to neglect this book. As for Dr. Coues himself, we can only imagine the sigh of relief with which he must have corrected the last proof of such a toilsome undertaking, although he must have been assured beforehand of the heartfelt gratitude of every ornithological *confrère* throughout the globe. R. B. S.

(i.) *Exposition Géométrique des Propriétes générales des Courbes.* Par Charles Ruchonnet (de Lausanne). Quatrième édition augmentée. (Paris, 1880.)

(ii.) *Éléments de Calcul approximatif.* Par C. Ruchonnet (de Lausanne). Troisième édition revue. (Paris, 1880.)

HAVING noticed both these works on the appearance of the last previous editions in 1874, we need say little here. The reasoning in i., we may remark, is always upon the curve itself, and is not derived by taking the limiting form of the inscribed polygon; and similarly in the case of surfaces. The work has grown from 160 pp. to 174 pp., and there is one more plate of figures.

The pamphlet ii. is, what it is stated to be, a revised form of the last edition. It consists of 64 pp. in place of 65 pp.

Geschichte der geographischen Entdeckungsreisen im Alterthum und Mittelalter. Von J. Löwenberg. (Leipzig und Berlin: Otto Spamer, 1881.)

THIS is a volume in the publisher's Illustrated Library of Geography and Ethnology. It is, as its title indicates, a History of Geographical Discovery in Antiquity and during the Middle Ages. The story is brought down to the time of Magellan and Martin Behaim. The first book, under the heading of Night and Morning, treats of the earliest dawn of geographical knowledge with the Hebrews, Egyptians, Babylonians, Phœnicians, Greeks, and Romans; the second book embraces the period from Herodotus to Ptolemy; the third, the Middle Ages; and the fourth the Century of Discovery, in which Spain and Portugal did such splendid work. Herr Löwenberg has evidently taken great pains to master his subject, and has been quite successful. He treats it in considerable detail, both in its historical and scientific aspects; the arrangement is excellent, and while popular and attractive in style, the work seems to us to be accurate and altogether trustworthy. There are numerous illustrations, some of them rather fanciful, but most of them useful and appropriate—portraits, ships of various periods, maps, some of them reproductions of very early ones, and

places and monuments illustrative of various countries. Altogether the work is a really good specimen of its kind. Another volume will bring the story down to the present time.

LETTERS TO THE EDITOR

[*The Editor does not hold himself responsible for opinions expressed by his correspondents. Neither can he undertake to return, or to correspond with the writers of, rejected manuscripts. No notice is taken of anonymous communications.*

The Editor urgently requests correspondents to keep their letters as short as possible. The pressure on his space is so great that it is impossible otherwise to ensure the appearance even of communications containing interesting and novel facts.]

The Tide Predicter

I SEE in your last number (p. 467), among the editorial notes, the following:—"Mr. Roberts of the *Nautical Almanac* office is authorised, by resolution of Council of the Secretary of State for India, dated August 7, 1880, to make it generally known that his Tide Predicter may be employed for the preparation of Tide Tables for any port for which the requisite data are forthcoming."

I think it right to call your attention to the fact that the Tide Predicter is in no sense of Mr. Roberts's invention or design. He was employed in 1873 by me, as chairman of the British Association Tidal Committee, to calculate the number of teeth in the wheels of the first Tide Predicter (now the property of the British Association, permanently deposited in South Kensington Museum), and to superintend its construction in London by Messrs. A. Légé and Co. The second Tide Predicter was made for the India Office, according to my advice, by Messrs. A. Légé and Co. of London, under the superintendence of Mr. Roberts. In respect to the plan of the wheelwork, which is wholly due to Messrs. Légé, it is a copy of the first instrument. It is an improvement on the first instrument in having twenty tidal components instead of ten, and in having the well-known rigorous method of the slide (Thomson and Tait's "Natural Philosophy," § 55, or "Elements of Natural Philosophy," § 72) for producing simple harmonic motion in a straight line from circular motion, instead of the approximate method of pulleys centred on crank-pins, which for simplicity and economy I used in the first instrument.

The University, Glasgow, March 19

The Magnetic Storm of 1880, August

THE Astronomer-Royal has handed to me a copy of the photographic record of the variations of magnetic horizontal force as registered at Toronto during the disturbed period of August 11 to 14 last. The records of declination and vertical force were imperfect and have not been received.

The comparison of the Greenwich and Zi-ka-wei (China) curves for the same period (NATURE, vol. xxiii. p. 33) indicated that the commencement and end of disturbance (especially the commencement) occurred nearly simultaneously at both places, and this circumstance is now further corroborated by the Toronto horizontal force curve.

In what follows, the reference throughout is to Greenwich time.

The disturbance at Toronto commenced on August 11 at 10.20 a.m. At Greenwich (NATURE, vol. xxiii. p. 33) it commenced also at 10.20 a.m., and at Zi-ka-wei at 10.16 a.m.; at Melbourne (NATURE, vol. xxii. p. 558) it commenced at 10.33 a.m.

Disturbance ceases at Toronto at about midnight of August 11, and at Greenwich and Zi-ka-wei also at about or near midnight, but it dies out more or less gradually, not allowing the limit of disturbance to be always very precisely fixed.

Sudden motion is again shown (after some hours of quiet) at Toronto on August 12 at 11.40 a.m.; also at Greenwich at 11.40 a.m.; some minutes sooner at Zi-ka-wei; and at Melbourne at about 11.38 a.m.

Disturbance again dies out more or less gradually at Toronto on August 14 about 7 a.m.; at Greenwich and Zi-ka-wei at about 6 a.m.; and at Melbourne at about 7 a.m.

The commencement of disturbance in the above instances is definite, and the agreement in time, considering the widely-separated geographical position of the four places concerned, is noteworthy. The cessation of disturbance is less definite, as i been already remarked, but even here the discordance in time not very wide.

WILLIAM ELLIS

Royal Observatory, Greenwich, March 12

Prehistoric Europe

I MUST adhere to my decision not to play the part of Secu any further to a glacial Retiarius in the arena of NATURE. If net be strong enough to carry the Upper Pleiocene and the Plei cene mammalia of Europe, as well as Palæolithic man and Neolithic skull of Olmo, I wish him joy of them. If, fortu he will kindly give me the proof that the mammalia of Anver considered Upper Pleiocene by Falconer, Gaudry, Gervais, other leading palæontologists, are, as he terms them, "i up," they shall be properly served and *iced*, if necessary, in second edition.

I feel however that it is only right for me to notice the gladiator who springs to the aid of his friend. The antiquity man in the Victoria Cave is solely due, as it appears to me the *perfervidum ingenium* (I speak in all respect) of Tiddeman. It was first based on a fragment of fibula wh ultimately turned out to belong to a bear. Then it was shown the cuts on two small bones, which were exhibited and discu at the British Association, at the Anthropological Institute a at the Geological Society of London. The bones are rec and belong to sheep or goat, two domestic animals introduc into Britain in the Neolithic age. The cuts have been pro made by a metallic edge. Numerous bones of the same ani in the same condition and hacked in the same way, occurred in Romano-British refuse-heap on the top of the clay, and quently slipped down over the working face to the bottom the cutting before I resigned the charge of the explorati Mr. Tiddeman after nearly four years' work. There were frequ slips afterwards. Under these circumstances the reader decide whether it is more probable that the mutton-bone question did slip down from a higher level to be picked up the bottom, or that there is evidence of "interglacial Geikie) or "preglacial" (Tiddeman) man possessed of domes animals and probably using edged tools of metal. The mu bones seem to me to prove so much on the latter hypothes that they may be thrown aside without further thought.

The reindeer (bones of feet) was found in 1872 along with rhinoceros, elephant, hyæna, and bison in the cave at the ol horizon, which afterwards was proved to contain the hippop mus. It was omitted in Mr. Tiddeman's lists up to 1876, wh I called his attention to the fact. Then he wrote that the that it was so found was "noteworthy," and that "these remai [his generalisations] were made solely on the evidence wh passed through your present reporter's hands since he under to conduct the exploration of the cavern" (Brit. Ass. Rep., 18 p. 118). Surely it is too late, in his letter to NATURE (March 1881), to recall this on the grounds that these remains discovered in a shaft, that my exploration was not carried so accurately as his own, and further, that because he did find the reindeer in the lower strata that I did not. It is not me to compare my own experience in cave-hunting with h to point out the value of negative evidence. The explorat while under my charge was *not* carried on by shafts only. W the hyæna-layer was reached it was followed in the deep cut visited by the British Association in 1873. The presence reindeer in the hyæna-layer renders Mr. Tiddeman's views tenable which are based on its assumed absence. Most of the points have been so fully argued out before the above-mentio societies, that I am sorry to be obliged to repeat them in letter.

W. BOYD DAWKINS

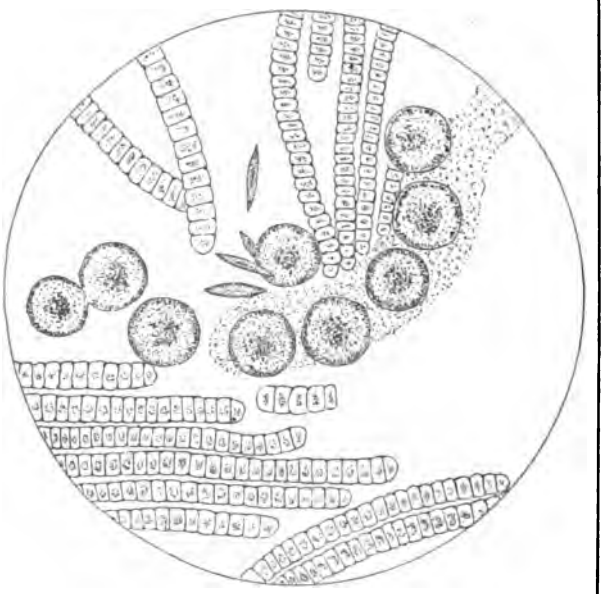
Owens College, March 11

Oceanic Phenomenon

H.M.'s surveying ship *Alert* was recently engaged in search for a "shoal" which was reported as existing some 200 miles the southward of Tongatabu, in the South Pacific. In the cour of the survey—which I may add tended to disprove the existe of any such shoal—it was observed that for several days the s surface exhibited large discoloured patches, due to the presen of a fluffy substance of a colour, and resembling consistency the vegetable only seen on the stagnan wat[illegible] the surface in irregul [illegible] and al[illegible] particles impregnat

ıe sea-water to a depth of several feet. Samples for examina-on were obtained by "dipping" with a bucket, as well as by ıe tow-net. It seemed to be a Confervoid Alga.

On slightly agitating the water in a glass jar, the fluffy masses roke up into minute particles, which, under a magnifying power f sixty diameters, were found to be composed of spindle-shaped undles of filaments. Under a power of 500 diameters these laments were seen to be straight or slightly-curved rods, articu-ated but not branching, and divided by transverse septa into ylindrical cells, which contained irregularly-shaped masses of ranular matter. These rods, which seemed to represent the ıdult plant, measured $\frac{1}{1000}$ inch in width. On carefully examin-ng many samples, some filaments were detected, portions of which seemed to have undergone a sort of varicose enlargement, eing more than twice as wide as the normal filaments. These propagating filaments (if I am right in so calling them) were nvested by a delicate tubular membrane, and contained some ranular semi-transparent matter, in which was imbedded a row of liscoid bodies; the latter appearing as if about to be discharged from the ruptured extremity of the tube. These bodies measured $\frac{1}{1000}$th of an inch in diameter: when seen edgewise presented a



lozenge-shaped appearance, and were devoid of cilia or striæ. Conjugation was not observed.

On allowing a jarful of the sea-water to stand by for twenty-four hours it was found that the confervoid matter had all risen to the surface, forming a thick scum of a dull green colour, while the water had assumed a pale purple colour, resembling the tint exhibited in a weak solution of permanganate of potash.

From November 24 to 29, during which time the ship traversed slowly a distance of 330 miles, the sea contained these organisms. For the first three days the large patches were frequently in sight, and during the rest of the time the surrounding water presented a dusty appearance from the presence of the tiny spindle-shaped bundles. On the evening of the 26th an unusually dense patch was sighted and mistaken for a reef, being reported as such by the look-out-man aloft.

Sydney, January 24 R. W. COPPINGER

Feeding a Gull with Corn

IN Prof. Semper's recently-published work on the "Conditions of Existence as they Affect Animal Life," a review of which from the pen of Prof. Lankester appeared in your columns a fortnight ago (vol. xxiii. p. 405), allusion is made on pp. 67, 68, and elsewhere to John Hunter's celebrated experiment of feeding a gull with corn. Prof. Semper, however, seems not to have been aware of the precise nature of the result of Hunter's experiment. He says: "The English anatomist Hunter purposely fed a sea-gull for a whole year on grain, and he thus succeeded in so completely hardening the inner coat of the bird's stomach, which is naturally soft and adapted to a fish diet, that in appearance and structure it precisely resembled the hard, horny skin of the gizzard of a pigeon."

The original account, I believe, of Hunter's experiment, was published in Sir Everard Home's "Lectures on Comparative Anatomy" (vol. i. p. 271, 1814), and an extract from that work is appended to the description of Hunter's original preparation, still preserved in the College of Surgeons, in the descriptive catalogue of that collection (vol. v., 1833, pp. 149-50, Prep. 523). What Hunter succeeded in effecting was to very much increase the thickness of the *muscular* walls of the gizzard, which, as may be seen by comparing his specimen (No. 523) with that of the stomach of another gull close by, have become developed to an extent about double their usual size. There is no manifest increase in the thickness of the "inner"—or so-called "epithelial"—coat of the stomach visible in the preparation, nor do Home or Owen allude to any such feature in their descriptions. Hunter's experiment, therefore, simply comes under the numerous well-ascertained instances of the increased development, consequent on increased use, of muscle, and has no real connection with the "modifying effects of food," such as that produced in canaries by feeding them on cayenne pepper, and others cited by Semper. W. A. FORBES

Zoological Society's Gardens, N.W., March 18

Dynamics of "Radiant Matter"

As the chief object of Mr. Preston's paper under the above title in NATURE, vol. xxiii. p. 461, seems to be to support Le Sage's "shelter theory" for gravity, you will perhaps let me point out one objection to that theory in any form which has hitherto been deemed conclusive, and with which Mr. Preston does not deal. It is that under it gravity would not vary, as it is known to do, equally with mass, but would vary *not* equally.

The theory applies perhaps so long as you consider only the case of isolated atoms, but it fails entirely when applied to clusters of atoms.

Observation shows that gravity varies only with distance and with mass; but if it were caused by any form of shelter hitherto imagined, it would vary also with density and with bulk in such a way that a pound of, say water, would weigh more than a pound if raised into steam, because its atoms, in loose order as steam, would give each other less shelter from the action of the kinetic æther than when in close order as water, and in such a way also that two spheres of, say iron, each weighing one pound, would weigh less than two pounds if welded into one sphere, because some atoms in the one sphere would be better sheltered than any atoms in the two spheres. WM. MUIR

March 21

The Oldest Fossil Insects

MR. S. H. SCUDDER has published (Anniversary *Memoirs* of the Boston Society of Natural History, 1880, pp. 41, plate 1) a memoir on the Devonian Insects of New Brunswick. The fragments of the six described species were discovered by the late Prof. C. F. Hartt in 1862, and have been since 1865 described in several papers by the same author. The new paper is a very detailed and elaborate one, with entirely new and improved figures, and is followed by a number of conclusions, as the final result of his work (Report, *Amer. Journ. of Sci.*, Feb. 1881). The conclusions would be of prominent importance for the history of the evolution of insects, if they could be accepted without reserve. Of course facts and conclusions should be able to stand the most severe test; and that is not the case with this publication. "As the simpler Devonian insects have certain special relations," he says, "with the Ephemeridæ, their description is preceded by an account of the wing-structure of the modern Mayflies as a basis of comparison" (p. 4).

The simple fact that not one of the described species has any relationship to the Ephemeridæ is sufficient to cause us to object to his descriptions and conclusions related to this family. This statement is not based upon a difference of opinion, but simply on the evidence of facts which cannot be denied by any one conversant with the families Ephemeridæ and Odonata.

Platephemera antiqua is a part of the apical half of the wing, without the tip, of a gigantic dragonfly. The suddenly narrowed second cubital space is to be found in Isophlebia of the Solenhofen slate. The imperfectness of the fragment allows no further conclusions.

Gerephemera simplex is a diagonal fragment of the middle of

a wing of a gigantic dragonfly. The reverse has a small part of the base, not to be seen in the obverse, with a straight sector crossing the horizontal ones. The same arrangement is to be seen in Isophlebia. Every other character important for nearer determination is wanting in the fragment.

Lithentomum Hartii.—The fragment is very insufficient, and recalls the venation of the Sialids, and among them those of the Chauliodes type.

Homothetus fossilis.—This is a Sialid of the Corydalis type, with a small number of transversals. The basal vein, spoken of as homologous with the arculus of the Odonata, and as proving a synthetic type, is the part in which the wing breaks off easily in actually living species. I have not seen the type.

Xenoneura antiquorum.—Some details given for this species are not exact. It has not been observed that parts of one wing cover the other; I can only say that the wing belongs to the Neuroptera, and that the venation is nearer to the Chauliodes type than to any other. The famous "stridulation" apparatus at the base is justly retracted by the author.

Four new families are proposed for these insects by the author. One of them, the Atoxina, is now out of the question, as Gerephemera belongs to the Odonata. The three others are only indicated by extremely vague characters, in fact by no characters at all. Can science accept such families? I believe not.

I omit *Dyscritus vetustus* because this fragment is undeterminable.

My conclusions are, that two of the insects belong to the Odonata, three to the Sialids. There is no Ephemerid among them, nor any synthetic species. The proofs for my statements will be given in a detailed paper. H. A. HAGEN

Cambridge, Mass.

Ice-Casts of Tracks

As I was riding along the highway late this afternoon, my attention was attracted to a phenomenon no less curious than beautiful. A couple of days ago there was a fall of a few inches of very damp snow, after which the temperature fell rapidly, and this morning everything was frozen hard. A large dog had trotted along in the snow while it was yet damp, and where it lay upon the old drifts by the road-side. To-day the sun has been shining very warm, cutting away all the new snow and leaving the tracks of the dog in exquisitely perfect ice-casts, thin as writing-paper, and standing on the most delicate thread-like columns, about an inch above the surface of the old snow.

Lyons, N.Y., March 7 J. T. BROWNELL

Migration of Birds

THE following extracts from a work entitled "Bible Customs in Bible Lands," by Henry J. Van Lennep, D.D. (1873), may prove interesting to some of your readers, as containing important and reliable evidence with regard to the migration of birds, which has formed the subject of two recent letters in NATURE.

Speaking of the great numbers of small birds which inhabit Western Asia, as compared with Europe and North America, Dr. Van Lennep explains the circumstance by the fact that "even those of feeblest wing have an easy road from Palestine, Syria, and Mesopotamia, by the Isthmus of Suez, and over the narrow Red Sea, to their winter quarters in tropical Africa, while nature has provided them with *extraordinary means* of conveyance from Asia Minor southward across the Mediterranean . . . The swallow, and many other birds of similar powers of flight, are able to cross over the entire breadth of the Mediterranean, especially by taking advantage of a favourable wind. But many birds are quite incapable of flying over a surface of 350 miles from headland to headland across the Mediterranean without alighting, and would require many days, and even weeks, to perform the trip through Syria and Palestine. Such are the ortolans, darnagas, bec-figs, wren, titmouse, smaller thrushes and finches, with a hundred other diminutive specimens of the feathered tribes . . . and as the severity of the winter would be fatal to them, not only in Asia Minor but even in Syria and Palestine, He who is ever mindful of the smallest of His creatures has provided them with means of transportation to a more genial clime. Many of them, indeed, find their way downward from Palestine into Arabia and Egypt, but this would be difficult, if not impossible where lofty mountains and broad seas intervene, and to meet such cases *the crane has been provided*. . . . Most of these birds are migratory. In the autumn numerous flocks may be seen coming from the north with the first cold blasts from that quarter, flying low, and uttering a peculiar cry as if of alarm, as they circle over the cultivated plains. Little birds of every species may then be seen flying to them, while the twittering songs of those already confined settled upon their backs may be distinctly heard. On their return in the spring they fly high, apparently considering their little passengers can easily find their way down to the earth. As Dr. Van Lennep has "spent almost a lifetime in the East," I conclude he has been an eye-witness of the above facts and therefore his testimony is conclusive. G. A.

Bath, March 16

Sound of the Aurora

WITH reference to the question mooted in last week's NATURE (p. 459) by M. L., Rouse as to the sounds emitted by aurora, perhaps the accompanying extracts may be of interest.

Brighton, March 20 EDWD. ALLOWAY PAKENHAM

"*Record of a Girlhood*," *F. A. Kemble. Vol. I.*

"Standing on that balcony [at Edinburgh] late one cold night, I saw for the first time the sky illuminated with the aurora borealis. It was a magnificent display of the phenomenon, and I feel certain that my attention was first attracted to it by the crackling sound which appeared to accompany the motion of the pale flames as they streamed across the sky. . . . indeed *crackling* is not the word that properly describes the sound I heard, which was precisely that made by the flickering of blazing fire; and as I have often since read and heard discussions upon the question whether the motion of the aurora is or is not accompanied by an audible sound, I can only say that on this occasion it was the sound that first induced me to observe the sheets of white light that were leaping up the sky. At this time I knew nothing of such phenomena or the doubts among scientific men to which they had given rise, and can therefore trust the impression made on my senses."

I BEG to assure Mr. Rouse that about fifteen years ago, as in the evening, in this very quiet locality, I listened, along with my father, to the sound of an aurora, pulsing above us, and the zenith, and appearing nearer to us, or lower, than the auroras I had seen. The sound was somewhat like the rustling or switching of silk, and we listened to it for some time with great curiosity. The aurora was not coloured, as more intense ones have sometimes appeared, but white. It recalled to me the lines of Burns in a fragment entitled "A Vision."

"The cauld blue north was streaming forth
Her lights, wi' hissing eerie din;
Athort the lift they start and shift,
Like fortune's favours tint as won."

Dumfriesshire, March 20 J. SHAW

Tacitus on the Aurora

WITH reference to the passage of Tacitus, "Germ." 45, quoted in NATURE, vol. xxiii. p. 459, I would suggest that the word *equorum*, proposed by some commentators, is far happier than *deorum*. "It is believed that a sound is heard, that the forms of the horses and rays from a head are seen." R. O. S.

Heidelberg, Germany

Aberration of Instinct

As an instance of "Aberration of Instinct," or I should rather say of *instinct at fault*, may be mentioned the following:—It is well known, I believe, that rooks in attacking young mangold wurtzel pick out the plants to obtain the wireworm at their roots. It happens that plants most infested with these insects are most flagged in the leaf. Now a neighbour whose sowing has been a partial failure transplanted some young wurtzels into the vacant places. These of course for a few days presented a flagged appearance, and were all seized on by the rooks to the exclusion of the rest. Poor disappointed creatures, what must have been their chagrin at finding no wireworm as they evidently expected!

Waldringfield Rectory, Woodbridge, March 16 T. H. WALLER

Squirrels Crossing Water

A CORRESPONDENT in NATURE (vol. xxiii. p. 340) is surprised to learn of the squirrel taking to the water. It is not an

amon thing for them to do so here, and they are frequently wned in making attempts beyond their strength.

Some years ago I was rowing on Lake George in this State, en I observed one of these little animals in an open place, ere from the course he was pursuing he must have swum urly half a mile. He seemed almost exhausted, and when I id my oar towards him he readily accepted the invitation to me on board, ran up the oar, and then to my surprise ran up r arm and ascended to my shoulder! I do not know whether simply followed his climbing instincts, or whether he sought elevated point to get an observation. However this may have en, after a short pause he descended and took his station in e bow of the boat, from which in a few minutes he plunged to the lake and struck out for land. He evidently miscalculated s remaining powers, for he was unequal to the effort, and soon adly availed himself of a second opportunity of gaining a place refuge. He now sat quietly while I rowed him towards the nd, evidently satisfied that he was in friendly hands, and that is wisest plan was to remain as a passenger. When close to ie shore he made a flying-leap and scampered for the trees, oubtless grateful in his little heart for the kindness that had elped him over the critical part of his voyage.

This was near the narrows of the lake, where it is about one ile in width, with groups of islands which shorten the traverses o less than a quarter of a mile. My little friend however had ot availed himself of the easier and more circuitous route, but ad boldly undertaken a directer course and a longer swim, which, ut for the timely rescue, would very likely have been his last quatic attempt. FREDERICK HUBBARD

New York, March 10

IN connection with a recent letter in NATURE on the squirrel aking to water, the following facts may be of interest:—While amping for two summers recently in the wilderness of northern New York, I was much surprised at frequently seeing squirrels rossing the ponds and lakes of the region. We would sometimes find several of these strange navigators in the course of an afternoon's row. They were seen most abundantly during the early part of July; indeed, later in the season, they were but rarely found. During many summers of camping elsewhere I have never seen them take to the water. It has occurred to me that the explanation of this peculiarity (if it be such) of the squirrels of this locality may be found in the nature of the region visited; for we find there a most intricate water-system, the whole region being dotted with ponds and lakes connected by small streams. The necessity of taking to the water at times has perhaps enabled the squirrels to overcome their aversion to this element, and they have thus become semi-aquatic in their habits. The squirrel to which reference is made is the common "red squirrel," *Sciurus Hendsonius*. C.

Worcester, Mass., March 8

IN the autumn of 1878 I was salmon fishing in the River Spey, a few miles from its mouth, where the stream was broad, strong, and deep—when just beyond the end of my line I perceived a squirrel being carried down, but swimming higher out of the water than is usual with most animals. Its death by drowning seemed inevitable, as the opposite bank was a high, perpendicular cliff of Old Red Sandstone, where even a squirrel could hardly land. However it swam gallantly on, heading straight across the stream, and finally, after being swept down a long distance, emerged on the other side, where a burn intersected the rock, and fir-trees grew down to the water's edge. The left bank, where the squirrel must have entered the river, was low and shelving, and it selected a spot, accidentally or otherwise, whence the current carried it opposite to an easy landing-place on the right bank. CECIL DUNCOMBE

March 18

THE LATE MR. E. R. ALSTON

THE death of Edward Richard Alston, which took place at his rooms in Maddox Street on the 7th inst., leaves a vacancy in the thin ranks of the working naturalists of this country that will not be easily filled up. At the time of his death Mr. Alston was secretary to the Linnean Society, a member of the Council of the Zoological Society, and treasurer to the Zoological Club, and up to within a few days of his decease was engaged in active zoological work. Mr. Alston, who died of phthisis at the early age of thirty-five, although somewhat retiring in disposition, was of a particularly kind and amiable nature, always most friendly with those with whom he was brought into contact, and ready to help them by advice or assistance. Mr. Alston was of Scotch parentage, and a native of Ayrshire. Being from infancy of delicate constitution he was educated chiefly under private tuition, and did not go to school or college. Notwithstanding these disadvantages he was a good scholar and a neat and concise writer, and had an excellent acquaintance with comparative anatomy. Taking early to the pursuit of natural history he became a contributor to the *Zoologist* and other popular journals, principally upon mammals and birds. Mr. Alston's first important paper was an account (published in the *Ibis*) of his journey to Archangel, made in 1872, in company with his friend Mr. J. Harvie Brown, in which excellent observations are given on the summer migrants and other feathered inhabitants of that previously little explored district. Shortly afterwards Mr. Alston moved his head-quarters to London during the first part of the year, and undertook the compilation of the portion of the *Zoological Record* relating to mammals, which he carried on in a very painstaking and methodical way for six years (1873-78). A new edition of Bell's British Mammals, which had long been called for, appeared in 1874. Mr. Alston, although he is only credited with having "assisted" in this work, was, we believe, its virtual compiler. From that date also he became a frequent reader of papers at the meetings of the Zoological Society and author of several excellent memoirs in the *Proceedings*. Amongst these we may call special attention to his revision of the genera of Rodentia, published in 1876, as a most successful exposition of the many difficult points connected with the arrangement of this group of mammals, and to his memoirs on the Mammals of Asia Minor, collected by Mr. C. G. Danford (1877 and 1880). Mr. Alston's last and most important work, which he had fortunately just brought to an end before his untimely death, was the "Mammals" of Salvin and Godman's "Biologia Centrali-Americana"—a great work on the fauna and flora of Mexico and Central America. The first part of this was published in 1879, the eighth number containing the completion of the Mammals in December last. The death of this promising naturalist, when in the full tide of work, must be a subject of universal regret among all lovers of science.

RECENT MATHEMATICO-LOGICAL MEMOIRS

THE Boolian reform of logical science is at last beginning to manifest itself and to bear the first-fruits of controversy. Thirty years ago Boole's remarkable memoirs were treated as striking but almost incomprehensible enigmas. Even De Morgan did not know exactly how to regard them, and in his "Syllabus of a Proposed System of Logic" (p. 72) thus allows their mysterious truth:—"In these works the author has made it manifest that the symbolic language of algebra, framed wholly on notions of number and quantity, is adequate, by what is certainly not an accident, to the representation of all the laws of thought." But time and the efforts of several investigators have cleared up much of the mystery in which Boole wrapped his logical discoveries. The controversies now going on touch rather the precise form to be given to the calculus of logic, than the former question of the new logic against the old orthodox Aristotelian doctrine.

The most elaborate recent contributions to mathematico-logical science, at least in the English language, are the memoirs of Prof. C. S. Peirce, the distinguished mathematician, now of the Johns Hopkins University, Baltimore. Not to speak of his discussions of logical ques-

tions in the *Proceedings* of the American Academy of Arts and Sciences (vol. vii. pp. 250-298, 402-412, 416-432), we have from him the wonderful investigation contained in his "Description of a Notation for the Logic of Relatives, resulting from an Amplification of the Conceptions of Boole's Calculus of Logic" (*Memoirs* of the American Academy, vol. ix. Cambridge, U.S., 1870, 4to). The contents of this remarkable treatise, which fills sixty-two quarto pages, demand the most careful study, but it would be quite impossible in this article to enter upon such study. Prof. Peirce has however quite recently interpreted his own views in a new memoir "On the Algebra of Logic," of which the first part, completed by the author in April last, was printed in the *American Journal of Mathematics*, vol. iii., and issued in September (4to, 57 pp.). After noticing the beautiful typography in which the *American Journal* rejoices, we find in this memoir a very careful inquiry as to what is really the form and nature of logical inference.

Prof. Peirce treats in succession of the Derivation of Logic, of Syllogism and Dialogism (a new name for a form of argument), of Forms of Propositions, the Algebra of the Copula, the Internal Multiplication and the Addition of Logic, the Resolution of Problems in Non-relative Logic, with a further chapter on the Logic of Relatives. The fundamental point, however, which is under discussion in the first two chapters touches the nature of the copula. There is abundance of evidence to show that given a few elementary forms, it is possible to spin out logical or mathematical formulæ simply without limit. But the superstructure rests entirely upon the basis of elementary truth contained in the first axioms. In logical science it is emphatically true that "C'est le premier pas qui coûte." There is a momentous choice to be made at the outset, and if we then take a wrong view of the nature of the logical copula, we can never come right again by any amount of development or formulisation.

Prof. Peirce after mentioning that four different algebraic methods of solving problems in the logic of non-relative terms have been proposed by recent English and German logicians, adopts a fifth, which he thinks is perhaps simpler and certainly more natural than any of the others. Peirce commences by expressing all the premises by means of the copulas $-<$ and $\overline{-<}$, "remembering that $A = B$ is the same as $A -< B$ and $B -< A$" (p. 37). These new symbols are to be interpreted so that $A -< B$ means (A implies B), in the way that water implies liquidity, or all water is liquid. The symbol $\overline{-<}$ is the negative of the above, so that $C \overline{-<} D$ means that C does not imply D. He then lays down five other processes which give the elementary theorems of the calculus, showing how to develop, simplify, transpose, and infer equivalency by these symbols. As however these processes occupy two quarto pages in their first statement, it is evident that they cannot be reproduced here. The question which really emerges is not as to the power and originality shown by Prof. Peirce, about which no reader of his memoirs can entertain the slightest doubt, but as to the wisdom of the first step, the selection of the relation expressed by the symbol $-<$ instead of that expressed by the familiar sign of equality $=$. Prof. Peirce begins by remarking that $A = B$ is the same as $A -< B$ with $B -< A$. For instance, all equilateral triangles are equiangular, and all equiangular triangles are equilateral. But though these two assertions are equivalent to "equilateral triangle = equiangular triangle," Prof. Peirce elects to treat the two parts of the apparently compound proposition separately, his reasons being given partially on p. 21. This is not the first time that the same choice has been made; for, not to speak of Aristotle and the Aristotelians generally, De Morgan elected to base his systems of logic upon inclusion and exclusion, instead of upon equality. In his symbols $X \parallel Y$ is compounded of $X)) Y$ and $X ((Y$ (Syllabus, p. 24). [illegible] to say all Xs are all Ys is made of all Xs are Ys a[nd] Ys are Xs. Now without going far afield, I believ[e] a sufficient reason may be given for holding that bo[th] Morgan and Peirce have chosen wrongly. A cl[ass] made up of individuals, and the very conception of a [class] thus implies the relation of identity expressed in A[ll] If I say the colour of glacier ice is identical wi[th] colour of pure rain water, it is impossible to bre[ak] assertion up into "The colours of glacier ice are [the] those of pure rain water," and "The colours of pure water are, &c." The colour is one indivisible and ide[al] Now if there is at the basis of all reasoning an elemen[tary] assertion of the form $A = B$, which is incapable of [reso]lution into anything simpler, this sufficiently proves Peirce's $A -< B$, or De Morgan's $A)) B$ cannot be original elementary form of assertion. Moreover, we say that all equiangular triangles = all equ[ilateral] triangles, the real basis of assertion is that each pos[sible] equiangular triangle is identical with one possible [equi]lateral triangle. The plural is made up of the singular, the singular is incapable of logical decomposition. may decompose $A = B$ into As are Bs, and Bs are but ultimate decomposition gives us $A' = B', A'' = A''' = B'''$, A', A'', &c., being individuals.

It is highly curious, however, that this very ques[tion] arises again with reference to the so-called Calcu[lus] Equivalent Statements recently published by Mr. [Hugh] MacColl, B.A., in the *Proceedings* of the London Ma[the]matical Society (First paper, November 1877, vol. [viii.] 9-20; Second paper, June 13, 1878, vol. ix. pp. 17[7]. Third paper, vol. x. pp. 16-28; Fourth paper, vol. [xi.] see also *Mind*, January 1880, pp. 45-60, and the *Philo[s]sophical Magazine* for September 1880).

There can be no doubt that Mr. MacColl has sho[wn] much skill in devising neat symbolic forms, and m[uch] power in using them. Comparing his processes w[ith] those of De Morgan, for instance, it is impossible [not] admire their symmetry and lucidity. But when we [go] the real point, the nature of assertion and inference, [we] obliged to hold that Mr. MacColl has, like De Morg[an] and Peirce, elected wrongly. What De Morgan expresse[d] by $X)) Y$, and Peirce by $X -< Y$, MacColl puts in [the] form $x : y$, calling the assertion an *implication*. Curiou[sly] enough, he professes never to treat of things, but only assertions, so that with him $x : y$ means that the asser[tion] x implies the assertion y, or whenever x is true, y is [true]. Having carefully considered Mr. MacColl's proposals, [I] felt obliged to write of them in a recent publication [as] follows:—"It is difficult to believe that there is [any] advantage in these innovations; certainly, in preferr[ing] implications to equations, Mr. MacColl ignores the neces[s]ity of the equation for the application of the Principle [of] Substitution. His proposals seem to me to tend towar[ds] throwing Formal Logic back into its Ante-Boolian con[fu]sion."

In a paper printed in the *Philosophical Magazine* [for] January 1881, Mr. MacColl takes me to task and invites me to make good the charge about Ante-Boolian con[fu]sion, by entering into a friendly contest in the problem columns of the *Educational Times*. Having just recently spent the better part of fifteen months in solving other people's problems, and in inventing some two or three hundred new ones, published in "Studies in Deductive Logic," I certainly [illegible] bound to sacrifice my peace of mind for [illegible] ears by engaging to solve any problem [illegible] Mr. MacColl or h[is] I therefore declin[e] easily explain w[hy] comes to much t[he] The great reform [illegible] tion the [illegible] mat[h]

ld true and simple results within the sphere of logic, t it disclosed wonderful analogy between logical and athematical forms, to which De Morgan adverts in the ssage quoted above. All true progress in the philoophy of those fundamental sciences depends upon ever eeping in view the fundamental identity of the reasoning ocesses, as depending on the process of substitution, actised explicitly by algebraists for some two or three nturies past, and implied in the geometrical reasoning Euclid.

But Mr. MacColl takes a backward step; he says he an make a simpler notation by taking $\alpha : \beta$ instead of y $\alpha = \alpha\beta$. In regard to form there is absolutely no ovelty in the implication, for it is simply De Morgan's)) Y, or the ancient Aristotelian proposition A is B. t is true that Mr. MacColl makes his terms consist of ssertions, so that all his assertions would appear to be ssertions about assertions—a needless complexity, landing s in the absurdity that a calculus of equivalent statements as no means of exhibiting the statements themselves. Mr. MacColl claims indeed considerable advantage for is notation on the ground that in the syllogism $(\alpha : \beta)$ $\beta : \gamma) : (\alpha : \gamma)$, the very same relation which connects α with β, and β with γ, connects also the combined premises $\alpha : \beta)$ $(\beta : \gamma)$ with the conclusion $\alpha : \gamma$. He thinks that ny notation is very clumsy and roundabout, because, as ny propositions treat of things or qualities, I should have o use words to express the inference of one proposition rom others. In that case Mr. MacColl must bring the ike charge of clumsiness against the whole body of mathematicians, because their equations are between hings or their magnitudes, and they still use language "hence," "therefore," &c., to express the fact that certain equations lead to other equations. If there is any mathematical sign to denote inference, it is rarely used, unless it be the familiar '.' and '∴', which are merely shorthand signs.

Mr. MacColl however, while pointing out the excellence of his implications, objects to my statement that he rejects equations in favour of implications on the ground that his method admits of both forms: "As a matter of fact," he says, "I employ both, sometimes even in the same problem. In my first paper . . . I adopt the equational form throughout; in my second and third papers, which relate entirely to questions of pure logic, I generally adopt the implicational form, as the simplest and most effective; while in my fourth paper, which treats of probability, I mainly adopt the equational form." There is nothing which I can see in this to contradict my objection that Mr. MacColl rejects equations *in favour of* implications. Mr. MacColl uses implications as "the simplest and most effective," but he adopts the equational form, I suppose, when he finds it indispensable; if not, why does he not hold to his simple and effective implication? If he finds one form best in logic and the other in mathematics, then he is ante-Boolian, because it was the whole point of Boole's labours to establish identity of method in logic and mathematics. I have really no wish to condemn Mr. MacColl's calculus or to enter into controversy with him, but in the interests of truth and sound science I must assert my belief that his implication $\alpha : \beta$ is at the best but a shorthand rendering of $\alpha = \alpha\beta$, which is Boole's form adopted by me. I have not said, and do not undertake to say, that Mr. MacColl's formulæ are not concise and neat. But a shorthand notation is bad if it obscures the real nature of the reasoning operation, and the fact that Mr. MacColl always keeps the equation in the background as a reserve method to call into operation when needed, shows to my mind that his methods are m n in a philosophical point of view. The very m method is "The Calculus of Equivalent and the word equivalent sufficiently implies n is at the bottom of the matter. The is that $\alpha : \beta$ has one letter less in it than $\alpha = \alpha\beta$, and to save the trouble of writing this one little letter Mr. MacColl would have us obscure all the grand and fertile analogies which Boole disclosed to the astonishment of mathematicians in 1847 and 1854. Mr. MacColl says: "The question whether the implication $\alpha : \beta$ or its equivalent the equation $\alpha = \alpha\beta$ should be preferred in a symbolical system of logic, must be decided on the broad grounds of practical convenience." It is not however a question of practical convenience, but of philosophical truth which is at issue, and in thus playing fast and loose with the equation, Mr. MacColl shows his entire want of comprehension of what is involved in the Boolian reform of logic. It may be added that were Mr. MacColl to discard implications and use only the equations which he admits are equivalent to them, there would be no formal difference between his calculus and that modified form of Boole's calculus which I proposed in 1864, and have been ever since engaged in developing, excepting indeed Mr. MacColl's unaccountable adoption of assertions as terms.

Perhaps it ought to be added that Boole, both in his "Mathematical Analysis of Logic," and in his great "Laws of Thought," introduces chapters on what he calls "Secondary Propositions" or Hypotheticals, which deal, like Mr. MacColl's assertions, with the truth of other assertions; but nothing emerges from Boole's discussion of secondary propositions except that they obey exactly the same formal laws as primary propositions, and are of course expressed equationally.

W. STANLEY JEVONS

ILLUSTRATIONS OF NEW OR RARE ANIMALS IN THE ZOOLOGICAL SOCIETY'S LIVING COLLECTION[1]

III.

THE animals we now speak of are again inhabitants of North-Eastern Asia—a country which, as before remarked, has of late years produced a considerable number of accessions to the list of Mammals. Both of them also belong to the great group of Ruminants—which is of special interest, as embracing all the animals upon the flesh of which civilised man principally subsists.

6. The Japanese Goat-Antelope (*Capricornis crispa*). For many years Siebold's "Fauna Japonica" was almost our only authority on Japanese zoology. The Dutch, having long had a monopoly of Japan, were enabled to stock their great National Museum at Leyden with a host of objects unknown to the other cabinets of Europe, but of which their travellers and residents managed to obtain specimens from various parts of the land where they only were permitted to penetrate. The "Fauna Japonica," although Japan is now open to all the world, still remains the best work of reference on the mammals of Japan. In it will be found the first description of the singular goat-like antelope of which the Zoological Society have recently obtained their first living example, drawn up by the celebrated naturalist Temminck, formerly director of the Leyden Museum. Temminck named the animal *Antelope crispa*, from the rough coat of hair which covers it, and tells us that it inhabits the higher alps of the Japanese Islands Nippon and Sikok, and is known to the Japanese as the "Nik." But a more complete account of its habits has lately been published by Capt. H. C. St. John in his recently-issued "Notes and Sketches from the Wild Coasts of Nipon." Capt. St. John tell us that the Japanese chamois, as he calls it, "is a very difficult animal to find, and to bag when found; they keep to the highest mountains, and to the highest and must rugged peaks of these ranges. I have hunted them with the natives, and with their dogs, and this often; and yet only once, although often close to the creatures, have I had a

[1] Continued from p. 417.

glimpse of one, much less a shot. On one occasion I was lucky enough to see one, and this was by mere accident, and when not in search of game. I have often been told fabulous stories about the Nigou, the native name for this wary animal. They were supposed to have one horn, and to use this single frontal ornament as a means of hanging on to trees as well as in self-defence. After some years of anticipation and endeavour to get even a dead specimen, I got a couple, and then, strange to say, several others were brought to me. A young male, alive, was caught, after its mother was shot. Only one specimen of all that were brought to me by the native hunters had both their horns intact—always one, and often both, being more or less broken. In hunting them with dogs, it soon became evident why this was so generally the case. The Japanese, who knew the animal's habits intimately, invariably placed me near some huge bare slab of rock, on which the Nigou, when pressed

FIG. 6.—The Japanese Goat-Antelope.

by the dogs, was expected to appear, and on looking at these slippery sloping platforms, I tried to conjecture—when waiting for the animal to appear—where, if I knocked one over, it would tumble, and what shape or form it would be in by the time it stopped. I could then easily understand why the horns were usually so damaged.

"I have no doubt also they are often caught in the bushes or trees by the slightly turned-back horns, on their falling and reaching the foot of these rocks; hence the origin of the story of their holding on to the trees.

"The young one which was brought to me alive was the most fierce little thing I ever saw. Any dog, large or small, that approached its cage, down went its head, and with a quick sudden spring the creature invariably came bang up against the wooden bars. Its horns were about two inches long, as sharp as needles, and quite capable of inflicting a very nasty wound.

"The colour of the 'Nigou' is a brownish slate; the older they get the lighter-coloured they beco

October 16, 1880 ; and on the same he above, a daily statement of the elements for some thirty stations orts of Mexico and at heights 80 feet above the sea. Annual re as, that for 1879 having been ce- an atmospheric pressure at Vera- the sea and only 11 feet above it, ng to the maximum, 30·075 inches to the minimum 29·851 inches in l distribution of the pressure holds evated stations are reached, when pressure remains pretty constant during the year. This peculiarity becomes strongly marked at Zacatecas, the highest station, 8189 feet above the sea, where the January and July pressures are the same, and the lowest mean, that of March and August, falls only 0·016 inch below the annual mean, and the highest, that of November, rises only 0·024 inch above it. At all the stations the singular protrusion of a high pressure into the Atlantic and adjoining regions in the height of summer is represented in the means.

Of the greatest possible interest are the curves of the diurnal oscillations of the barometer, deduced from the hourly observations at the central station at Mexico, these curves being quite distinct, so far as we are aware, from the curves of any other intertropical place for which observations exist. The peculiarity lies in this, that while the morning maximum and the afternoon minimum remain large at all seasons, the morning minimum diminishes in amount as the summer advances; and during the strictly summer months it does not even fall so low as the daily mean. Now this is an outstanding peculiarity of the curves of diurnal pressure in the extra-tropical inland region of the great European-Asiatic continent, and it becomes the more pronounced the more we advance into the interior of that continent. This result, viewed in connection with the other diurnal curves, forms a very valuable contribution to this difficult branch of the science.

The mean temperature for 1879 at Mexico, 7434 feet high, was 59°·5, May being the warmest month, 64° 6, and December and January the coldest, 55°·4; and these were generally the months of extreme temperature over the

Resumen de las Observaciones practicadas en ... durante el Año de 1879." (Proceedings of the Institute)
Boletin del Ministerio de Fomento de ... ii. 21, 79, &c.

different districts of Mexico. The period of the year when temperature is highest is also the period when the air is driest, the mean relative humidity of Mexico for April and May for 1878 and 1879 being only 42. The mean temperature of Tlacotalpam, the lowest station, was 77°·5, and of Zacatecas, the highest from which mean temperatures are published, 61°·7. The difference of the two is thus 15°·8, and as the difference of height is 8178 feet, the fall of temperature with the height is comparatively slow, being only one degree for each 518 feet.

At Mexico during 1879, out of the 8760 observations made of the wind, 4156 cases were reported as calm, being nearly a half of the whole of the observations. By far the most frequent wind is the north-west, which was observed 1299 times; next follow the north-east, 789 times, and north 636 times; and the least frequent, south, 174 times, and south-west 278 times. As regards direction, the prevailing winds at Mexico were a point to the north of east in February and March, from which they gradually worked round to north-east in the beginning of May, north in July, north-west in September, thence again to north in the end of November, and back to east in February. On these changes of the wind, considered with reference to the Gulf of Mexico and the Pacific, largely depends the rainfall. The rainy season extends from about the middle of May to the end of October; but at eastern stations showers are of not infrequent occurrence from November to April, when prevailing winds are northerly and easterly. The largest annual rainfall was 89·16 inches at Tlacotalpam, and the least 15·66 inches at San Luis Potosí. Thunder and lightning are of common occurrence during the summer months, these phenomena occurring on 66 per cent. of the days during June, July, and August. During the five months from December to April thunderstorms occur only on 7 per cent. of the days. The position of Mexico, as already stated, marks it out as a region peculiarly suited for the investigation of some of the more interesting meteorological problems, particularly those which concern the vertical distribution of the phenomena, in connection with which an increase to the number of low-level stations on the Gulf of Mexico and the Pacific sea-boards is very desirable.

ON THE IDENTITY OF SOME ANCIENT DIAMOND MINES IN INDIA, ESPECIALLY THOSE MENTIONED BY TAVERNIER

HAVING recently endeavoured to correlate the diamond deposits of India, I have been surprised to find what a mass of contradiction exists in both Indian and English literature as to the identity of some of the most famous mines which were worked little more than 200 years ago.

In this brief account I propose to give results, not the steps which have led me to them. Tavernier about the middle of the seventeenth century visited and described three diamond-mines, which were named respectively Raolconda in the Carnatic, Gani, called Coulour by the Persians, and Soumelpour on the Gonel River.

Raolconda, Tavernier says, was five days distant from Golconda and eight or nine from Bijapur, and most writers with signal unsuccess have tried to fix it accordingly. But elsewhere Tavernier gives nine stages, aggregating probably 189 miles, on the road from Golconda to Raolconda, so that in the first statement the distances were probably transposed. With these new indications we are led to an old town called Rawdukonda, lat. 15° 41′, long. 76° 50′. I have not yet succeeded in obtaining any independent testimony of the existence of diamond-mines at this locality, but hope to be able to hear more about it ere long.

Gani, or Coulour, where Tavernier says the Great Mogul diamond was found in the sixteenth century, has been variously located by authors, being supposed by many to be identical with Gani Purtial, on the K… River; but I am satisfied from the evidence afforde… old maps that it is to be identified with Kollur, lat. 1… 30″, long. 80° 5′, which is also on the Kistna, about twe… six miles further to the west. Now as to this word G… which has been treated of as a proper name, its re… rence in connection with two different localities sugge… that it means mine. In fact since G and K are … changeable letters in some Indian languages we sho… probably read for Gani *Kan-i*, or the mine of Purti… of Kollur.

If, as seems most probable, the Koh-i-nur is ide… with the Great Mogul diamond described by Taver… and that the great age claimed for it by the Hindus … be regarded as mythical, then in fact for the first … the identity of the source from whence this fa… diamond was obtained may be regarded as settled. … of the eighteenth century indicate diamond mines at … (*i.e.* Kan-i) Kollur, though local memory of their … existence appears to have died out.

Soumelpour, on the Gonel River of Tavernier, … generally by recent authors been identified with Sa… pur, on the Mahanadi, in the Central Provinces. … Tavernier's somewhat precise indication of its positio… led me to the conclusion that it was situated much f… to the north, namely, in the valley of the Koel Rive… tributary of the Sone. At about the distance stat… Tavernier (which I calculate to be the equivale… eighty miles), to the south of the well-known fortre… Rhotas, there are near the banks of the Koel Rive… Tavernier's Gonel) the remains of an ancient town … Semah, which word is identical with *Semul* (the … name of a species of cotton-tree, *Bombax Malabaric… Semulpour, or the town of the *Semul*, is therefor… seems probable, Tavernier's Soumelpour. The posi… of Semah is lat. 23° 45′, long. 84° 21′; it is inclu… the sub-division of Palamow, in the Chutia Na… Province. There is independent evidence of impo… diamond mines having existed in a neighbouring pa… Chutia Nagpur in the sixteenth century, but there … been none in operation there for many years.

The last locality is Beeragurh, which is mentione… the *Ain-i-Akbari*, and also in several other … writings. This is unquestionably identical wi… modern Wairagarh in the Chanda district of … Central Provinces, where excavations locally know… have been diamond mines are still to be seen. Waira… is in lat. 20° 26′, long. 80° 10′. Many allusions wh… believe to refer to this locality might be quoted. Co… the fifteenth century by Nicolo Conti is of espe… interest. He says that at Albenigaras, fifteen … journey north of Bijapur (Bijengalia), there is a mou… which produces diamonds. The method of obtai… them, which he describes on hearsay, is similar to tha… the celebrated Arabic myth which the travels of Sinde… the sailor and of Marco Polo have made familiar … every one.

The idea of the diamonds being collected by throwi… pieces of meat freshly cut from a slaughtered cow … buffalo into a valley inhabited by venomous serpent… which pieces, with diamonds sticking to them, were picke… up by birds of prey and recovered from them by th… diamond-seekers, probably took its rise from some sac… ficial custom in connection with the worship of the … sanguinary goddess of riches, wh… (Thom… p. 95) allud… nder the name … wars, as the… partners … The piece… from th… victim w… hrown abou… were nat… p and carr… This I be… een the fou… the fabulo… was erecte… Beeragur… is, as th… 324 miles f… thwards, … might therefo… mplish…

as there is sufficient resemblance with the Arabic prefix *Al* to make re identical. V. BALL

NOTES

ress is being made with the reprint of d's scientific papers, the publication early in the summer. It will form a vo pages, illustrated by more than woodcuts. Mr. Hubert Herkomer, rtist, has most kindly undertaken to ate professor, as a frontispiece to the be limited to a very small number of are already subscribed for. Those nes to the list of subscribers before d to communicate at once with the lemorial Fund, 11, Hanover Square, ad to receive subscriptions already crossed "London and County Bank,

y on Friday last, Mr. Sclater calls e collection of birds of the late John id been offered to the Trustees of the and expressed a hope that there will : of the Treasury in sanctioning the in is stated to embrace about 1500 inted specimens of humming-birds, s the descriptions and figures in the the Trochilidæ" were taken. There s of various groups, amongst which milies of Toucans, Trogons, Birds of

lectures will be given by Members of ysics appointed by the Lords of the ducation:—An Introductory Lecture, S., April 6. A Lecture on the tudying the Influence of the Sun on y Lieut.-General Strachey, R.E., Two lectures on the Connection rial Phenomena, by Prof. Balfour and 29. Six lectures on Spectro- r Chemistry, by Mr. J. Norman , 6, 11, 13, 18, and 20. Three of the Infra-red of the Spectrum in sies, by Capt. Abney, R.E., F.R.S.

The lectures will be delivered in South Kensington Museum at 4 p.m. Admission will be by tickets, which here is room, on application by letter ind Art Department, South Ken-

aders that the French Association April at Algiers, beginning on the en enrolled members will have the railway travelling, and of a special s to Algiers. This ship will leave ling at Port Vendres on the 12th. ime ago, but by addressing, without neral Secretary of the Association, rticulars relating to the excursions, nd attractive, some of them includ- ahara, will be given. An industrial ed in Algiers, with races, *fêtes*, and n Institute, which is directed by M. Faswell-Lyte, Hon. Foreign Secre- tary of the Association, Science Club, Savile Row, will be happy to afford further information to intending English visitors.

THE arrangements for the International Medical and Sanitary Exhibition are progressing so satisfactorily that it promises to be the most important Sanitary Exhibition hitherto organised in this country. Applications for space are now being rapidly sent in, as the 31st inst. is the last day fixed by the Committee for receiving them. Up to March 15 applications for 984 feet had been received by the Committee. The Certificates of Merit which are to be given will be valuable awards to the public and to the successful exhibitors on account of the high character of the list of jurors, which already includes among many other the following:—Medical Section: Christopher Heath, F.R.C.S., Wm. S. Playfair, M.D., Charles Higgins, F.R.C.S., Chas. S. Tomes, F.R.S., Prof. John Marshall, F.R.S., Dr. Robert Farquharson, M.P., the president of the Pharmaceutical Society, C. H. Golding-Bird, F.R.C.S., Lionel Beale, F.R.S., W. B. Carpenter, C.B., F.R.S., J. S. Bristowe, M.D., Major Duncan, R.A., Surgeon-General Longmore, C.B., E. H. Sieveking, M.D., &c., &c.; Sanitary Section: Sir Joseph Fayrer, K.C.S.I., M.D., F.R.S., Geo. Aitchison, F.R.I.B.A., Edwd. C. Robins, F.S.A., T. Roger Smith, F.R.I.B.A., F. J. Monat, M.D., Alfred Waterhouse, A.R.A., Capt. Douglas Galton, C.B., F.R.S., Ernest Hart, M.R.C.S., Prof. Corfield, Wm. Eassie, C.E., Roger Field, M. Inst. C.E., R. Thorne Thorne M.B., Prof. Pretwich, F.R.S., &c., &c. In addition to the interest taken in the Exhibition by medical men, architects, and manufacturers, the general public have recognised the importance of the work thus initiated by the Executive Committee of the Parkes Museum of Hygiene by subscribing to the Guarantee Fund, which at the meeting of the Committee last Tuesday was reported to amount to 1026*l.* 7*s.* At this meeting the Secretary read a letter from Mr. MacCormac, the Hon. Sec. General of the International Medical Congress, forwarding the following resolution which had been unanimously passed by the Executive Council of the International Medical Congress at their last meeting:—"That the sum of fifty pounds be guaranteed to the Committee of the International, Medical, and Sanitary Exhibition, to be held at South Kensington in connection with the Parkes Museum of Hygiene, on the occasion of the International Medical Congress."

THE programme for the annual meeting of the Iron and Steel Institute on the 4th, 5th, and 6th of May has just been issued. The first item on the programme is the presidential address of Mr. Josiah T. Smith, the president-elect, whose experience as one of the earliest and for many years one of the largest steel manufacturers in this country, and as the head of the most extensive works of their kind in the world, will give his address an exceptional interest. The papers to be read cover pretty fairly the whole field of the manufacture and application of steel for shipbuilding purposes. A paper will be read by Mr. Alexander Wilson of Sheffield on the manufacture of armour plates. The subject of the manufacture of steel and steel plates will be dealt with by Mr. Sergius Kern of Russia, who will describe improvements recently practised in Russia; while the experience lately gained in the practical use of steel for shipbuilding purposes will be dealt with in a paper by Mr. Denny of Dumbarton, at whose works on the Clyde a considerable amount of steel shipbuilding has been turned out during the last two years. The important question of the relative corrosion of iron and steel will be discussed by Mr. William Parker of Lloyd's. Another paper is promised by Capt. Jones, manager of the Thomson Steel Works, Pittsburg, on the manufacture of Bessemer steel and steel rails in America.

SCIENTIFIC honours are being paid to John Duncan, the weaver botanist. Recently the Inverness Scientific Society and

Field Club elected him an honorary member with a gift of 5*l.*, and the Banff Field Club gave 1*l.* 1*s.* When his story was first told by Mr. Jolly in *Good Words* in 1878, the Largo Naturalists' Society, one of the most active in the country, elected him an hon. member. The Edinburgh Field Naturalists' Club have lately issued a special circular and appeal on his behalf. Last week he was elected an hon. member by the Aberdeen Natural History Society, when a sketch of his life was given by Mr. Taylor, one of his pupils. Miss E. Brown has sent us 1*l.* for the John Duncan Fund.

WE see from a long article on the subject in the New York *Nation*, that the "Reports on the Total Solar Eclipses of July 29, 1878, and January 11, 1880, issued by the U.S. Naval Observatory," have appeared. We have not received a copy of the work yet, but from the article in the *Nation* it is evidently a valuable contribution to some of the questions suggested by solar eclipses.

THE Commission Supérieure of the Paris Electrical Exhibition has already deliberated on all the demands sent by French electricians. The utmost liberality has prevailed, and only a few technical questions have been reserved for more mature deliberation. But the authorisations will not be made definitive until after April 1, when the list of would-be exhibitors will be closed. The resolution of the Society of Telegraph Engineers and Electricians to organise the English section has been received with great satisfaction.

WE take the following from the *Gardener's Chronicle*:—Dr. Aitchison, Surgeon-Major in the Punjaub army, whose collections in the Kurrum Valley we alluded to on a former occasion, has returned from Afghanistan with another extensive collection of dried plants, and is now at Kew engaged in working them up. Amongst other interesting museum objects Dr. Aitchison has brought home specimens of *Chamærops Ritchieana*, a palm that covers miles of the alluvial plains with a dense bushy thicket. Frequently too it occurs as a branching tree fifteen to twenty-five feet high, but then usually in the vicinity of other trees or buildings. Dr. Aitchison's specimens illustrate this peculiarity exhibited by comparatively few other palms.

WE are glad to learn that the museum building begun some time ago under the auspices of the Perthshire Society of Natural Science is approaching completion. To equip and endow the museum a bazaar will be held in Perth towards the end of the year.

THE translation of Nägeli and Schwendener's treatise on the Microscope is approaching completion. Messrs. W. Swan Sonnenschein and Allen now announce its speedy issue to the public, which they trust will be effected during the present spring. The English editors, whose names will appear on the title-page, are Mr. F. Crisp (Secretary of the Royal Microscopical Society) and Mr. J. Mayall, jun., F.R.M.S., though several others have collaborated in the work. Messrs. Sonnenschin and Allen also announce for immediate issue an illustrated "Manual of Insects Injurious to Agriculture," by E. A. Ormerod, whose "Report of Injurious Insects for 1880" we reviewed in a recent number; and a second edition of "Prantl's Text-Book of Botany," by Vines, greatly revised, the first edition of which appeared last year.

WHERE is Mackay? "Here," we fancy a score of our readers will reply; but none of them would be "the real Mackay," as they say in the North, at least not the Mackay whose local habitation we inquire after. Happily we can answer our own question from the Christmas number of the *Mackay Standard*, a fact that shows that our Mackay must be considerably to the fore somewhere. "Mackay, according to the single archive at present extant to which we have been able to attain access, was first discovered by a gentleman of the name of M Scotchman as his name would denote. That this is more than probable, but it does not appear that, beyo his name to the place, he ever did anything to rende famous. It may accordingly be accepted as a fact tha covered the existence of the Pioneer River on which th situated, and the date of this discovery is placed at 186 within a few days Mackay is twenty years of age. Th District is in latitude 21° 10′, and is situated at a distan miles to the north-west of Brisbane, on the Pioneer Ri then Mackay is nobody at all, but a flourishing new would be a "city" in the States) in Queensland, with and wharves and warehouses, and prosperous sugar- "Clifton-on-the-Sea," a fashionable summer resor Mackayites, twelve miles off. The municipality (345 said to have fifty miles of streets under its control nothing said about houses, so most of them may not the quarry or the brick-kiln yet. The population of is given as 7500.

ON Friday will take place at Père Lachaise the in of the monument erected by public subscription Spinelli and Sivel, the two victims of the tragic *Zen* Speeches will be delivered by M. Paul Bert, Pr Physiology to the Sorbonne, who organised the su Hervé Mangon, director of the Arts-et-Métiers, wh president of the Société de Navigation Aérienne, then and M. Gaston Tissandier, who was a party in the a escaped by a marvellous concurrence of circumstances.

ON Wednesday last week at 12.10 a.m. another shoc quake was felt at Casamicciola and Lacco Ameno people fled to the open country; much consternation the people fear other shocks. Little damage was do few injured walls and a tile factory have fallen. Ves

A RATHER severe shock of earthquake was felt at March 17 at 3h. p.m., duration two seconds. It w panied by wave-like motions of the ground.

IT is announced that the entire length of the St Railway between Airolo and the Lago Maggiore will by the end of June; but the great tunnel, owing to about the vaulting, cannot be completed before Novem

THE Conseil d'Hygiène of Paris has just issued a volume of 700 pages recounting all the precautions tak several so-called "Industries Insalubres" practised in P work of the Conseil d'Hygiène extends over a peri years, from 1872 to 1877, and relates to more than 200 in some of their essential details. Amongst the recomm made are a refrigerating machine for dead-houses and establishment for cleansing contaminated objects w heated vapours. Amongst the curious observation analysis of a parasitic vegetation developing on brea military. It appears the original sporulæ were bro Germany by soldiers taken prisoners in the Franco-Ger returning home.

AS the preparation of dynamite has acquired great im M. Gobi shows (*Memoirs* of the St. Petersburg Soc. of formerly the best dynamite was made with the "Kiesel Hanover, which can absorb as much as 75 per cent. glycerine, but is now made with the diatomaceous depo Randanne, in the department of Puy-de-Dôme, w absorb from 73 to 78 per cent. of nitroglycerine. It i of notice that both these formations have been dest Ehrenberg. It is obvious that the good quality of prepared from these two deposits depends upon the pr the small *débris* of the frustules of the microscopical and that, when determining the qualities of a distu

NOMICAL COLUMN

—In a communication to the Academy
e 7th inst., M. Puiseux has discussed
al contacts during the last transit of
at stations occupied by the French
de observations of second and third
d, Nagasaki, Saigon, and Kobé, and
nnea. Seventeen equations are fur-
3 various combinations are made by
the method of Delisle. The former method supplies twelve separate results, the concluded parallaxes varying from 8″·78 to 9″·17, which are arranged according to the amount of the parallax factor: the simple arithmetical mean is 8″·98. On Delisle's method the combinations for second contact give fourteen values between 8″·86 and 9″·20, of which the mean is 9″·01, and those for third contact furnish ten values between 8″·63 and 8″·90—the mean being 8″·92. These figures considered with respect to others which have been obtained from observations of the same transit and on other methods, cannot be said to enlighten us materially as to the true amount of the sun's mean parallax. M. Puiseux thinks the observations of contact in 1874 have not given results so accordant as astronomers had looked for, but he nevertheless is far from discouraging efforts to secure observations of contacts in 1882; the phenomena in 1874 did not present that geometrical simplicity which had been formerly expected, but presented a succession of phases which were the more difficult to identify in the records of the observers according as the telescopes employed were more dissimilar; and he urges (1) that the different stations should be provided with telescopes of large aperture, to be employed under as identical circumstances as practicable, and (2) that the observers should be exercised "à l'aide d'appareils convenables," to appreciate in the same manner the appearances which the contacts may offer. The former consideration at least is too well understood as of paramount importance to be likely to be overlooked by any of the national committees now engaged in arranging for the most efficient observation of the transit in 1882.

VARIABLE STARS.—Minima of Algol occur by Schönfeld's formula on April 3 at 10h. 51m. G.M.T., and April 6 at 7h. 40m., and the next series observable in this country commences on May 13 at 14h. 17m.

In the uncertainty that exists with respect to the period of Ceraski's circumpolar variable, the following calculated times of minima are only to be regarded as rough indications:—

	h. m.		h. m.
April 3 ...	12 56 G.M.T.	April 18 ...	11 58 G.M.T.
8 ...	12 37	23 ...	11 38
13 ...	12 17	28 ...	11 19

A constant period of 2·49326 days is here assumed. Prof. C. H. Peters publishes details of his observations of a number of new variable stars (*Astron. Nach.*, No. 2360), and Dr. Pümer notifies the variability of the red star Schj. 57 *a*, which stands thus in the *Durchmusterung*:—

	h. m. s.		
9·4m. ...	R.A. 5 17 32·7 ...	Decl. + 34 2′1

This star was invisible in the Lund refractor on January 29, but was well seen on February 23; in September and October, 1878, he had confirmed its fiery-red colour, and found the spectrum of the Class III. δ. V Hercules varies from 8m. to 12m., and the period seems to be about 290 days; the next maximum may be expected in October of the present year.

ANCIENT ASTRONOMY.—In No. 2 of the new periodical, *Uranía*, is an elaborate paper by Prof. Schjellerup of Copenhagen, "Sur le Chronometre Céleste d'Hipparque," in which he discusses the question "Comment les anciens astronomes ont-ils déterminé l'heure de la nuit, et à quelle exactitude ont-ils pu parvenir?" In this paper he has calculated by the strict trigonometrical formulæ (an investigation of which is prefixed) the positions of the forty-four stars mentioned in the third book of the only work of Hipparchus which has descended to us. His "Three Books of Commentaries on the phenomena of Aratus and Eudoxus," printed for the first time in 1567 (Lalande, "Bibliographie," p. 91) from two manuscripts of the Bibliothèque Medicea and the Library of the Vatican. Petau brought out a new edition, to which he availed himself of an ancient well-written manuscript preserved in the Bibliothèque Royale, and which forms part of the third volume of his "Uranologion." Prof. Schjellerup gives the Greek text essentially after the edition of Petau, with as nearly as possible a literal translation. He concludes his paper with the remark, "Dans l'état actuel on peut prouver que les Astronomes d'Alexandrie ont pu déterminer le temps sidéral presqu'à une minute près." It contains the right ascensions and declinations of the stars in question for every hundredth year, from − 300 to + 100, with the amount of proper motion to the respective epochs, and is a production which merits the attention of those who are interested in the Astronomy of the Ancients.

THE ACADEMY OF SCIENCES, PARIS.—At the annual public sitting of the Paris Academy on the 14th inst. the Lalande Prize

was awarded to Mr. E. J. Stone, director of the Radcliffe Observatory, Oxford, for his great catalogue of southern stars, involving newly-determined places of all the stars observed by the French astronomer Lacaille during his memorable visit to the Cape of Good Hope, in the years 1751 and 1752; the observations for the catalogue having been made while Mr. Stone occupied the position of Her Majesty's Astronomer at the Cape. The commission to whom the consideration of the award was referred consisted of MM. Faye, Mouchez, Lœwy, Janssen, and Tisserand, who have called attention in their Report to the "fundamental importance" of the Catalogue, in view of the study of the proper motions, &c., of the stars in the southern heavens.

At the same sitting the Valz Prize was adjudged to M. Tempel of Florence for his numerous cometary discoveries.

The Damoiseau Prize (10,000 francs) has been again proposed for 1882. It had been offered without response in 1869, 1872, 1876, 1877, and 1879; the subject on all occasions being the same and a very important one in the actual state of astronomy, viz., "To review the theory of the satellites of Jupiter, to discuss the observations and to deduce the constants which it contains, and particularly that which furnishes a direct determination of the velocity of light; and lastly, to construct special tables for each satellite."

BIOLOGICAL NOTES

Algæ of the Gulf of Finland.—M. Chr. Gobi made an excursion along the borders of the Gulf of Finland in the summer of 1879 with the object of investigating the algæ of this district. In spite of the weather being of the most unfavourable character he was enabled to work out the whole south-west coast of this district, from St. Petersburg to the comparatively open sea at Hapsal. Along the southern coast of the Island of Kotlin, on which Cronstadt is built, and also along the opposite coast shore at Oranienbaum, chlorophyllaceous algæ were almost exclusively met with, and these belonging to species to be also met with in the fresh waters of the adjoining lands, for example, three distinct species of Cladophora (among these *C. glomerata*), several forms of the genera Oedogonium, Spirogyra, Zygnema, and other filamentous Mesocarpeæ; various Desmidiaceæ (Cosmarium, Closterium, Scenedesmus), a much-branched, very fine, almost hair-like Enteromorpha (apparently *E. salina*), also various oscillatoriaceous forms and diatoms. Besides at Cronstadt an Ulothrix, more commonly in the early summer months, and a Merismopœdia (probably *M. Kützingii*) at Oranienbaum, the pretty *Spirulina Jenneri*, amidst various Oscillatoria, was met with, also Vaucheria, and in larger quantities *Hydrodictyon utriculatum*, in the various stages of development (middle of August). About seven versts west of Oranienbaum Tolypothrix was met with in some quantity, forming floating ball-shaped masses. By the end of July some excursions to the environs of Hapsal led to the discovery of the interesting Phœospore, which up to this had only once been found by Pringsheim at Heligoland, and called by him Strebloncma; in Hapsal Bay it lived on Ruppia, several Charas, and in company on these with *Ulothrix confervicola*, which latter grew in great abundance on these plants and on Ceramia and other red algæ. It is interesting to note that along with marine forms there grew some of the fresh-water filamentous algæ, such as Spirogyra, Zygnema, and in large quantities that half fresh-water species *Monostroma Balticum*. Out in the bay towards the open sea the red algæ increased in number, but the merging of the fresh-water forms into those of a truly marine type could be well studied in the Bay of Hapsal. (*Botanische Zeitung*, February 20.)

The "Blake" Cruise.—Numbers 1 and 2 of volume 8 of the *Bulletin* of the Museum of Comparative Zoology at Harvard College contain preliminary reports on the Echini collected during the cruises of the *Blake*, by Alex. Agassiz, and on the Crustacea by Alphonse Milne-Edwards, have just reached us. The report on the Echini contains descriptions of thirteen new species belonging to such genera as Dorocidaris, Cœlopleurus, Asthenosoma, Phormosoma, Palæotropus, and Schizaster. Perhaps no group of animals has received such marked additions to its ranks through the deep-sea dredging expeditions. There was a time, and that not long ago, when we remember that the prevalent idea was that in this class new species were scarcely to be expected to turn up. Alphonse Milne-Edwards' report, of which the first part only is published, treats of the Brachyurous Decapods and of a portion of the Macrura. Many new genera and species are described, and several are figured. One very remarkable new genus, Coryeodus, is formed to receive a what mutilated example, which however exhibits different from any known Crustacea, belonging apparently the family Dorripedæ. Its carapace is globular, and connected to (coudée) the sternal plastron and between insertion of the articulations of the first and those of the pair of feet there is to be found a considerable space. very interesting new genera belonging to the Paguridæ scribed. Among the new species of the Galatheidæ no less than eleven belonging to the genus Munida; and genus allied to Munida, Galathodes is described with species. It is evident that the number of species belonging the Crustacea have been very largely increased by the sea exploration carried on by the United States Coast steamer *Blake*.

Food of Birds, Fishes, and Beetles.—The State Legislature of Illinois authorised at its last session an investigation the food of the birds of the State, with especial reference agriculture and horticulture, and a similar investigation of food of the fishes, with especial reference to fish-culture. result several Bulletins have been issued from the State Laboratory of Natural History, of which the last just received contains a report on the food of fishes by S. A. Forbes, director of the Laboratory, the class especially reported on the Acanthopteri, and another on the food of birds by the same. A very interesting series of notes on the food of predaceous beetles, by F. M. Webster, is added. Many species are found to be vegetarians, sometimes doing the growing crops a great deal of mischief.

Physiological Significance of Transpiration in Plants.—Prof. Weiss concludes from experiments (Vienna Acad. *Anz.*) that transpiration is only prejudicial to the functions of plants, excepting the process of lignification of cell-walls, which it favours; hence it is to be regarded as a necessary evil for plants. Prof. Weiss also obtains striking evidence in favour of Wiesner's theory of heliotropism; and he considers prove that through transpiration certain inorganic constituents the ground are carried to plants in excess, and are got rid on the fall of leaves in autumn, and consequently that transpiration is also the cause of the influence exercised by the nature the ground on the quantitative composition of the ashes plants. The view that the stronger growth of non-transpiring plants is due to mere expansion of cells without simultaneous over-production of organic substances, is controverted.

Signs of Death.—Observations with regard to the manifestations of life in animals variously killed have lately made by Drs. Verga and Biffi (*Real. Ist. Lomb. Rend.*). The following conclusions are arrived at:—1. In the higher animals, when sensibility, circulation, and respiration have ceased, the life of histological elements of the nervous centres especially of the ganglionic system and the spinal cord, remains for a short time. 2. Contraction of the pupil and of the eyelids are effects of this reduced latent life, and more remarkable effects, in guinea-pigs, rabbits, and cats, are the constant and uniform movements of inward curvature, which have the significance of respiratory efforts, presented under like conditions in the dog and the ass. 3. These movements appear in the same whether drowned in water, or hung, or bled to death. 4. To indicate the point beyond which the organism loses the power of recovery.

Classification of Statures.—In view of the increasing need of exactness in anthropological descriptions, Prof. Bertillon has lately proposed in the Lombard Institute a system of classification of human statures. He first constitutes three divisions, denoting by the terms *mesosoma*, *megasoma*, and *microsoma* medium, high, and low stature respectively. At the ends of each series are added divisions for gigantic and dwarfish stature, *gigantosoma* and *nanosoma*. Each of these five classes is divided into three parts, on this plan: *medium mesosoma*, *hypermesosoma*, and *hypomesosoma*. To attach numerical values to all these fifteen divisions is more difficult. The author makes 2·00 metres the division between very high and gigantic stature, and gigantosoma ranges from that point up to 2·51 m. or more (hypergigantosoma). On the other hand 1·25 m. is made the limit between very low and exceptionally low stature; and nanosoma ranges from this to 0·74 or less (hyponanosoma). Medium stature (mesosoma) ranges from 1·60 m. to 1·70 m.

Equus Prjevalski.—The St. Petersburg Geographical Society has just published a pamphlet, by M. Poliakoff, on the

De Castries contributes a paper on the region of the Wed Draâ; M. Ch. Velain, geological notes on Upper French Guiana; and M. H. Duveyrier, on the question of the sources of the Niger.

DR. RAE sends us the following extract from a letter to him by Capt. Howgate, dated Washington, March 4, 1881:—"I write . . . to tell you that Congress has given the appropriation asked for the continuance of our work and Lady Franklin Bay, and also for an expedition *via* Behring Strait—ostensibly to look after the *Jeannette*, but also to prosecute the work of discovery in that direction. In addition to this it is proposed that the Signal Service will this year establish the Point Barrow station, making a noble programme of Arctic work for the United States, and one in which I take just pride, for it is the direct result of my persistent work, since 1877, in raising public interest in the cause."

THE preparations for the commencement of the survey of Eastern Palestine are now complete. The War Office have granted to the Committee of the Palestine Exploration Fund the services of Lieut. Conder, who executed most of the survey of Western Palestine, and Lieut. Mantell, both of the Royal Engineers. The party will include the two non-commissioned officers (now both pensioners) Black and Armstrong, who first went out in the year 1871. Lieutenants Conder and Mantell started for Beyrout on Tuesday evening, March 15, and the men will follow with the instruments. The work will be commenced in the north—the land of Bashan.

FROM a Buenos Ayres paper we learn that the long-promised exploring expedition to Neuquen, the most fertile spot perhaps in all South America, and part of the territory secured by General Roca's memorable expedition, has at last started, and important results are expected from it. This territory lies along the foot of the Andes, is watered by innumerable streams flowing from the great range into the Rio Neuquen, one of the two rivers which form the Rio Negro, and presents facilities for agriculture unknown in any other part of the Republic.

THE current number of *Les Missions Catholiques* contains a long letter from Père Schmitt, written from Mboma on the Lower Congo, in which he describes a journey lately made to the foot of the Yellala Falls. He paid a visit to the station of the Livingstone (Congo) Inland Mission at Matadi or Matavi, which is situated on the left bank of the Congo, opposite Mr. Stanley's settlement at Vivi. Owing to the whirlpools in the river, landing at Matadi was accomplished with great difficulty. From Père Schmitt's account, the spot hardly appears to have been well chosen, being a melancholy sort of place, covered with rocks, as its name imports. The mission establishment consists of five or six tents, the interior of which reminded the visitor of a bazaar. On the return journey Père Schmitt spent a few days at Noki, where he had an opportunity of collecting information respecting the Congo region from the son of the king, who had been educated at St. Paul de Loanda.

ACCORDING to the *London and China Express*, the sole obstacle to the contemplated maritime surveying operations in China and Japan, under the direction of the United States Hydrographic Office, has been removed by the consent of the Russian Government to the occupation of an astronomical station at Vladivostock by United States naval officers. They are to proceed there at once, and by telegraphic exchange of time signals, working from Vladivostock through Japan and China to Madras, will determine with great exactness the longitudes of Yokohama, Nagasaki, Shanghai, Amoy, Hong-kong, Manila, Saigon, and Singapore.

THE Wellington correspondent of the *Colonies and India* states that the New Zealand Government have just succeeded in acquiring a large tract of land at Rotorua, in the famous Hot Lake district, every acre of which the Maoris have hitherto jealously preserved. Even now tourists from all parts of the world visit this wonderful and beautiful district, but, when it is made more accessible, it is thought that Rotorua will become a great sanatorium for India and the colonies.

KING OSCAR of Sweden has just conferred decorations on Prof. Virchow, Dr. Nachtigal, and Herr William Schoulank, in recognition of their services in the cause of geographical discovery and commerce.

DR. HAYOT has been deputed by the French Minister of Marine to explore the upper part of the Niger.

ON THE CONVERSION OF RADIANT ENERGY INTO SONOROUS VIBRATIONS[1]

MESSRS. GRAHAM BELL and Sumner Tainter (American Association for the Advancement of Science, Boston, August 27, 1880) have shown that under certain conditions intense rays of light, if allowed to fall with periodic intermittence upon thin disks of almost every hard substance, will set up disturbances in those disks corresponding to this periodicity which result in sonorous vibrations. Mr. Bell (*Journal* of the Society of Telegraph Engineers, December 8, 1880) has subsequently shown that such effects are not confined to hard substances, but that they can be produced by matter in a liquid or gaseous form.

These discoveries have elicited a considerable amount of interest, and have led to the inquiry whether the sonorous effects are due, as the discoverers themselves surmised, to *light*, or as the president of the Royal Society, Prof. Tyndall, and others have suggested, to radiant *heat*.

Messrs. Bell and Tainter have partially answered this question by showing that the disturbances are not necessarily due to light, for they found that sheets of hard rubber or *ebonite*—a substance opaque to light—do not entirely cut off the sounds, but allow certain rays to pass through, which continue the effect. M. Mercadier, who has studied the subject with great care (*Comptes rendus*, December 6, 1880), has shown that the effects are confined to the red and ultra-red rays. Moreover Mr. Bell has shown that gases, such as sulphuric ether, which Prof. Tyndall has proved to be highly absorbent of heat rays, while they are transparent to light rays, are remarkably sensitive to this intermittent action. Dr. Tyndall has more recently read a paper before the Society (*Proc.* Roy. Soc., January 3, 1881) proving that these sonorous effects are a function of all gases and vapours absorbing radiant heat, and that the intensity of the sounds produced is a measure of this absorption.

The negative proof of Messrs. Bell and Tainter can be rendered positive if it can be shown that ebonite is *diathermanous*.

By very careful experiments made upon the diathermancy of different materials, ebonite proved to be as diathermanous as rock-salt.

It is therefore clear that the sonorous vibrations of Bell and Tainter are the result of disturbances produced by some thermic action rather than by any luminous effect.

Now the questions arise, Is this thermic action expansion and contraction of the mass due to its absorption of heat? Or is it a disturbance due to molecular pressure similar to that which produces the rotation of the radiometer? Or is it due to some other cause?

The argument against the first assumption when applied to hard disks is that *time* is a material element in such actions, and that the rate of cooling of warmed diaphragms is too slow to admit of such effects. Lord Rayleigh (NATURE, January 20, 1881) has questioned the validity of this argument, and has shown that if the radiating power of the body experimented on were sufficiently high a slow rate of cooling would be favourable to rapid fluctuations of temperature. It became desirable to test this point experimentally. Very delicate apparatus was constructed for the purpose.

Heat from various sources and at various distances, from bright lime-light to dull heat from hot metallic surfaces, was allowed to fall through rotating vanes intermittently on different bodies; but notwithstanding every precaution, and the many materials used, not more than six interruptions per second could be produced, although the system was beautifully sensitive to the smallest changes of temperature.

It was evident from these experiments that the sonorous effects of hard disks could not be explained by the change of volume due to the impact of heat rays and their absorption by the mass of the disk.

Is the action then due to molecular pressure similar to that which produces the rotation of the radiometer?

It is quite true that the radiometer effect is one visible only in very high exhaustions, but Mr. Crookes (*Phil. T* Part i., § 220) detected "the existence of mole when radiation falls on a black surface in density."

Whenever radiant energy falls on an absorbent such as a disk of blackened wood, its wave-leng

[1] Abstract of a paper by Mr. William Henry Preece, re Society, March 10.

or lowered, and it is converted in thermometric hea molecules of air striking this warmed surface acquire hea move away from it with increased velocity, and as actio reaction are always alike in moving away, they give the "kick." Since there is no such action on the other side disk, there is a difference of pressure between the tw which gives it a tendency to move away from the sou energy. The effect is very much smaller in air at ve pressures than in air at a very low vacuum, becaus former case the mean free path of the molecules is very and the rebounding molecules help to keep back the slowly approaching molecules. Nevertheless, molecular is experienced, and if of sufficient magnitude and mas ought to produce sonorous vibrations. It seemed probab the element of time does not enter here so prominen the previous case, for the radiometer effect is a mere action of the disk, and not one affecting its mass. It was hoped that the retarding effects would be eliminate the sonorous action, therefore, be due to a radiometer act difference of effect would be observed if the side of *exposed* to the source of energy be either blackened by black or camphor carbon, or if it be polished or whitene

An apparatus was constructed similar in principle described by Messrs. Bell and Tainter.

An ebonite disk well blackened on one side when expo the intermittent rays was found to produce sounds, w similar ebonite disk equally well-whitened, gave slig intense sounds. A zinc disk blackened gave weak sounds a similar disk polished gave sounds much weaker. A mic blackened gave scarcely any sounds at all, while a clean disk gave slightly better sounds.

These effects were produced many times and on occasions, and they were so unsatisfactory as to throw the accuracy of the radiometer explanation. They were decided as theory led one to anticipate. The effects by the zinc disk, though very weak, favoured the theory given by the mica disk completely refuted it; while those by the ebonite disks were almost of a neutral character.

The question occurred whether in Bell and Tainter's ments *the disks vibrated at all*.

A delicate microphone was fixed in various ways on or holding the disks. Although the sounds emitted in the tube were quite loud, scarcely any perceptible effect was on the microphone. Had the disk sensibly vibrated, tions must have been taken up by the case. A mic never fails to take up and magnify the minutest mec disturbances.

It was thus evident that the disk did not play a prime this phenomenon, but that the result might be due wh expansion and contraction of the air contained in the behind the disk.

With a new clean case and an ebonite disk the sonorous were feeble, but if a lens were placed close in fron ebonite disk, so as to make a second air space in fron disk, the sonorous effects were magnified considerably.

The ebonite disk was fitted with an extremely delicate phone, which in this case gave good indications upon phone, but whether the vibrations were the result vibrations of the disk itself, or of the air in which the mic was placed, was doubtful.

If the lens were removed and the disk left supported any air cavity, either behind or in front of it, *no perceptible could be obtained*, proving that the effects were really due vibrations of the confined air, and *not to those of the d* was therefore determined to dispense with the disk alto The disk was therefore removed, the lens remaining sonorous effects were *nil*.

Another case was tak out the disk, but the ef results which had ye between the one case blacked in the interio Hence the former c h when clean it g phor smoke, it g ceed. It was t assisted by coat absorbent su phor. It this pheno

gives up its heat to the sides of the
. Though the pitch of the maxi-

mum note varied with the cavity and the amount of radiant heat transmitted, its quality never varied, notwithstanding the great diversity of materials used as diaphragms.

Since these sonorous effects are due to the expansions of absorbent gases under the influence of heat, and since wires are heated by the transference of electric currents through them, it seemed possible that if we inclosed a spiral of fine platinum wire in a dark cavity, well blacked on the inside, and sent through it by means of the wheel-break, rapid intermittent currents of electricity from a battery, heat would be radiated, the air would expand, and sounds would result. This was done, and the sounds produced were excellent. In fact, with four bichromate cells sounds more intense than any previously observed were obtained.

Furthermore it was evident that if the wheel-break were replaced by a good microphone transmitter, articulate speech should be heard. This was done, and an excellent telephone receiver was the consequence, by means of which speech was perfectly reproduced.

The explanation of these remarkable phenomena is now abundantly clear.

It is purely an effect of radiant heat, and it is essentially one due to the changes of volume in vapours and gases produced by the degradation and absorption of this heat in a confined space. The disks in Bell and Tainter's experiments must be diathermanous, and the better their character in this respect the greater the effect; remove them, and the effect is greater still. Messrs. Bell and Tainter (*Journal* of Society of Telegraph Engineers, December 8, 1880) showed that the sounds maintained their *timbre* and pitch notwithstanding variation in the substance of the disk, and M. Mercadier found that a split or cracked plate acted as well as when it was whole. These facts are consistent with the expansion of the contained air, but not with any mechanical disturbance of the disks. Moreover M. Mercadier showed that the effect was improved by lampblack, but he applied it in the wrong place.

The disks may, and perhaps do, under certain conditions, vibrate, but this vibration is feeble and quite a secondary action. The sides of the containing vessel must possess the power to reduce the incident rays to thermometric heat, and impart it to the vapour they confine, and the more their power in this respect, as when blackened by carbon, the greater the effect. The back of the disk may alone act in this respect. Cigars, chips of wood, smoke, or any absorbent surfaces placed inside a closed transparent vessel will, by first absorbing and then radiating heat rays to the confined gas, produce sonorous vibrations.

The heat is dissipated in the energy of sonorous vibrations. In all cases, time enters as an element, and the maximum effect depends on the diathermancy of the exposed side of the cavity, on its dimensions and surfaces, and on the absorbent character of the contained gas.

THE EARTHQUAKE IN ISCHIA

THE Island of Ischia, the Pithecusa of the ancients, is some twenty miles in circumference, and appears to be the continuation of the north-western boundary of the Gulf of Naples. It consists of an old volcanic mountain sloping down on all side to the sea. The southern rim of the old crater has been remove by denudation, leaving the northern as a curved serrated ridge, forming the peak of Monte Epomeo.

Situated on the southern slopes of the island are only a few and unimportant villages.

Going from east to west along the northern slope we have first the capital Ischia, then we encounter the great trachytic lava stream which issues laterally from the slope of Epomeo, and after a course of two miles entered the sea, forming a promontory. This is the so-called lava Del' Arso, of A.D. 1302. Next are encountered two very fresh-looking craters, from which lava streams have flowed. Then we come to Casamicciola, a small town of about 4000 inhabitants, to the north-west of which is the village of Lacco Ameno. At the eastern end of the island is the town of Forio.

The district in which are situated Casamicciola and Lacco is thus bounded on the north by the sea, on the south by the ridge of Monte Epomeo, on the west by a spur stretching from the latter into the sea, forming the Punta Cortiacchio, and on the east are the two hills called Monte Rotaro and Montagnone, the new-looking craters already spoken of.

It is worth observing that from this side of the island the four or five historic eruptions have occurred, and all the principal thermo-mineral springs are confined mostly to this district.

It is at this very spot that the late earthquake has taken place, resulting in the total destruction of Casamicciola, with the exception of the hotels, baths, and a few well-constructed private houses. A hundred and twenty bodies have been excavated, and they are not all, besides 160 seriously wounded. At the village of Lacco thirteen houses have fallen, and five deaths are reported.

On March 4, at five and a half minutes past one p.m., a terrific shock shook the whole island, but its maximum intensity was at this point leaving Ischia and Forio almost uninjured, together with the villages on the opposite side of the mountain.

There was but a moment of premonitory trembling, when the terrific blow shook the houses about the ears of their inhabitants. The corpse of the shoemaker was found in his usual position, with the last between his knees, and we saw the corpse of a woman with the half-finished stocking in her hand and the needle in its sheath. The two cases show the suddenness of the catastrophe.

The first shock was described as a sudden blow beneath the feet, followed by a series of undulations, which appear from accounts to have radiated from a point which I shall immediately describe. This was followed shortly by faint vibrations, accompanied by loud subterranean thunder, such as was heard in the slight earthquake of last July.

On visiting the island a few hours after we were struck by the severity of the shock and by its extremely limited area. Following the methods adopted by our eminent countryman Mr. Mallet, F.R.S., in his investigations of the great Neapolitan earthquake of 1857, we have come to the conclusion that the undulations occurred in a series of closed curves radiating from a point which must have been situated about a quarter of a kilometre to the south-west of the upper town, that is in the direction of Lacco.

It is interesting to note that the seismographs at Naples and Vesuvius were not at all affected by the earthquake. This led Prof. Palmieri to conclude from the extremely local effects produced that the phenomenon was due to the excavation and removal of matter by the mineral springs and the collapse and falling in of the superincumbent ground. It seems difficult to satisfy oneself with the theory of my respected teacher and friend Prof. Palmieri for the following reasons :—

1. The collapse of earth in Cheshire in no way produces effects at all similar or equivalent to those under consideration, and yet the amount of salt in solution removed is equal to much more solid matter than is removed by the dilute mineral waters of Ischia which are also small in quantity. Landslips like that of Lyme Regis are quite incomparable in effects to the present case.

2. The waters that issued immediately after the disaster were as usual clear, and flowed at the same rate. If this explanation was tenable, then the collapse of the earth should have forced out a large body of water and vapour and have rendered the former turbid and muddy. Such however was not the case.

3. The disturbance in Ischia was coincident with the seismic movements that were felt in various parts of Europe from the 2nd to the 5th of March, and which was severe throughout Northern Italy.

We know from the following facts that Ischia cannot be reckoned amongst extinct volcanoes. The great number of fumaroles and thermo-springs that exist on its surface ; the sand on the sea-shore in some parts is so hot a few inches from the surface that the hand cannot be borne in it ; the continual seismic disturbances to which it was and is subject—all point to the conclusion that there still exists igneous matter not far from the surface.

The seismic waves of the beginning of March causing increased tension in the igneous matter through which they travelled would tend to rupture the superficial crust at its weakest point ; the Island of Ischia presents to us such suitable conditions, and the volcanic matter, vapour, or lava may by those means have endeavoured to force its way towards the surface.

The formation of a fissure, together with the blow that would be produced by the immediate falling of such, would explain the phenomena. Much the same results occur from the formation of a dyke in an active volcanic mountain ; in fact the conditions may be looked upon as analogous.

Although lava has failed to reach the surface on the present occasion, a repetition may be sufficient to produce an eruption such as has often occurred at this spot. We may look for homologues of the present earthquake in that of A.D. 63, preceding the outburst of Vesuvius in 79, or those that destroyed Pozzuoli and its neighbourhood immediately before the formation of Monte Nuovo, but which were not felt at Naples.

The fact that the undulations produced little effect on the southern side of the island shows the extreme thinness of the earth-crust at this spot ; the weight and bulk of the mountain configuration acting as deterrent agents to the propagation of the seismic undulations to any great distance. The earthquakes in Ischia have at times been very disastrous, compelling even Greek colonies to forsake the island. There is generally a slight shock about once a year, nearly always accompanied by subterranean thunder. These have sometimes caused ruin, as on February 2, 1828, when three or four houses fell and some thirty people were killed. The details of the observations being made will be published as soon as they are formulated.

It is an interesting fact that since writing the above, on comparing notes with Signor P. Franco, my colleague, who our observations were quite independent and unknown to other, yet we have arrived at exactly the same conclusions almost every detail.

H. J. Johnston-Lavis

UNIVERSITY AND EDUCATIONAL INTELLIGENCE

Oxford.—The following notice respecting scholarships Natural Science has been published by Merton College :—

There will be an election in June next to one (or two) Physical Science Postmastерships.

The examination will begin on Tuesday, June 28 ; it will be held in common with Magdalen College, and at the same time and place. Candidates may give in their names at either College, but all will be regarded as standing at both, unless special notice is given to the contrary. In the event of election a candidate will be requested to state which College he would prefer. The Postmasterships are of the annual value of 80*l*., and are tenable for five years from election, provided that the holder does not accept or retain any appointment incompatible with the pursuance of the full course of University studies. After two years' residence the College may raise, by a sum not exceeding 50*l*. per annum, the Postmastership of such Postmasters as shall be recommended by the Tutors for their character, industry, and ability. Candidates for the Postmasterships, if members of the University, must not have exceeded six terms of University standing, but there is no limit of age. The subjects of examination will be Chemistry and Physics. There will be a practical examination in Chemistry. Candidates will have an opportunity of giving evidence of a knowledge of Biology ; but it must be borne in mind that in such cases the examiners will look for evidence of an acquaintance with the principles of Chemistry and Physics at least equal in extent to that which is required in the Preliminary Honour Examination in the Physical Science School. A paper will be set in Algebra and Elementary Geometry (Books I.-VI.), and a Classical paper of the standard required by the University for Responsions.

Magdalen College has published the following notice respecting Natural Science Scholarships (Demyships) :—There will be an election at this College in June next to not less than three Demy-ships, of which one at least will be Mathematical, one at least in Natural Science, and the rest Classical. No person will be eligible for the Demyships who will have attained the age of twenty years on October 10 next. The stipend of the Demyships is 95*l*. per annum, inclusive of all allowances : and the are tenable for five years, provided that the holder does not accept or retain any appointment which in the judgment of the electors will interfere with the completion of his University studies.

The Oldham Lyceum and Science and Art Schools, opened by Lord Derby last Thursday, seems to be a handsome and useful building, and under Mr. Phythian's superintendence we have no doubt much good work will be done in the future as in the past. Chemical and physical laboratories and other arrangements for scientific work have been provided for.

t record of the occurrence of this
Bowdler Sharpe exhibited a speci-
's Snipe (*Gallinago Saboini*). This
bird had been shot in July last by the Hon. W. W. Palmer at Woolmer Pond, near Selborne, Hants.—Prof. F. Jeffrey Bell, F.Z.S., read the fourth of his series of observations on the characters of the Echinoidea. The present paper dealt with most of the genera of the Echinometidæ; their systematic affinities were discussed and their relations to the Echinidæ shown to be so intimate as not to justify their separation into two distinct families.—A second paper by Prof. Bell gave the description of a new species of the genus *Mesoplita*, obtained at Samoa by the Rev. S. J. Whitmee, which the author proposed to name after its discoverer, *M. Whitmei*.—Mr. W. A. Forbes read the fourth of his series of papers on the anatomy of Passerine birds. The present communication was devoted to the consideration of some points in the anatomy of the genus *Conopophaga* and of its systematic position.—A communication was read from Prof. Newton, F.R.S., in which he proposed to substitute the name *Hypositta* for *Hyphorhyx*, which he had formerly proposed for a genus of Passerine birds found in Madagascar.—A communication was read from Mr. M. Jacoby containing descriptions of new genera and species of phytophagous coleoptera.

Physical Society, March 12.—Sir W. Thomson in the chair.—New Members: Mr. Colville Brown, Dr. J. P. Joule.—Col. Festin read a paper by Capt. Abney and himself, on the absorption spectra of organic bodies. The method of photographing the infra-red region of the spectrum gave better results for absorption than thermopile. Organic compounds were chosen as giving the larger molecules. The apparatus employed consisted of a small Gramme machine driven by a Brotherhood engine, and an electric lamp with a plexlex for shifting the negative pole so as to get the crater on one side of the other carbon point. The image of the positive pole was allowed to fall on the slit of the spectroscope; the light of the arc not being used. Three prisms were used, and a camera with a back-swing to it so as to get a considerable length of spectrum in focus. Maps of the various spectra were made with six inches of the substance examined inclosed in a glass tube. Alcohols, acids, oils, and water were examined, and gave spectra of bands and lines. When hydrogen was absent in the compound there were no lines, and the authors conclude the lines to be due to hydrogen. Oxygen appeared to obliterate the space between the lines and make it a band. The authors hope by this method to detect the radicles present in a substance. They found correspondences between some lines and lines in the solar map. Dr. Coffin said that two kinds of chloroform, apparently the same, produced different physiological results: the method might distinguish between these. Sir William Thomson thought it might throw light on the ultimate constitution of matter.—Mr. Brown read a paper on the definition of work in text-books, and gave reasons for preferring that in Rankine's books.

Anthropological Institute, March 8.—F. W. Rudler, F.G.S., vice-president, in the chair.—The election of Dr. G. D. Thane was announced.—A collection of rubbings taken from door-posts and window-frames in New Zealand was exhibited. They were chiefly interesting from the proof which they afforded of the clear influence of matted and woven materials on the ornamentation of stone architecture, a parallel to the influence of wood architecture on stone architecture pointed out by Fellows in Lycia and by Lepsius in Egypt; also from the remarkable coincidence between some of these ornamentations and the outlines on the tombstones of Mykenæ, a near approach to the triglyph in New Zealand.—A short note by Mr. S. E. Peal, on Assam pile-dwellings, was read, and was illustrated by a series of sketches by the author.—Lieut.-Col. R. G. Woodthorpe, R.E., read a paper on the wild tribes inhabiting the so-called Naga Hills on our North-Eastern frontier of India. The paper dealt only with the Angami Nagas, who, it was stated, differ from all the other hill tribes of Assam in many important particulars, such as appearance, architecture, mode of cultivation, language, and dress. In appearance they are a finer, cleaner, and better-looking race than their neighbours; they build their houses resting on the ground, and not raised on piles as all the other hill tribes of Assam (except the Khasias) do, and after a pattern not seen elsewhere. Differences in physical or topographical conditions do not account for this difference in the style of architecture, as the Angami villages are found on the same ridges as, and often not a mile from, villages constructed on the other principle. In dress the Angami differs most strikingly from all the other tribes in the kilt or short petticoat of dark cloth ornamented with rows of white cowrie

shells, the waistcloth of all other Nagas consisting only of a flap of cloth in front and behind, and often only in front. The Angamis erect tall monoliths in commemoration of the dead or of some social event. These monoliths, often of great size, are dragged up hill on sledges running on rollers. The paper was illustrated by a large collection of specimens and drawings, and also by some fine diagrams, in the preparation of which the author had been much assisted by Mr. C. Holroyd.

Royal Microscopical Society, March 9.—The president, Prof. P. Martin Duncan, F.R.S., in the chair.—Swift and Sons' new "working" microscope and fine adjustment and the "Griffith Club Portable Microscope" were exhibited.—Mr. Powell showed *Amphipleura pellucida* with the vertical illuminator, and Mr. Stephenson pointed out that the illumination was not "opaque," as supposed, but that the diatom was illuminated by transmitted light reflected back by its own under-surface.—Mr. Crisp exhibited Prof. Abbes' radiation apparatus for showing the increased amount of light emitted by a radiant in glass or balsam compared to one in air.—Mr. A. D. Michael read a paper on a supposed new species of Acarus, *Dermaleichus heteropus*, and Dr. E. Cutter's paper on a supposed Infusorian in the nasal passage in cases of catarrh was explained by Mr. Stewart and commented on by the president.—Discussions also took place on carbolic acid for mounting, and on the "Society" standard screw.

Meteorological Society, March 16.—Mr. G. J. Symons, F.R.S., president, in the chair.—Rev. A. J. C. Allen, E. Chapman, Rev. E. W. Ford, G. T. Gwilliam, H. B. Jupp, A. Ramsay, and J. Stokes were elected Fellows.—The President gave a historical sketch of various classes of hygrometers, and described about 120 different patterns; after which an exhibition of instruments was held, showing various kinds of hygrometers, and also some new instruments which have been brought out since January 1, 1880.

Victoria (Philosophical) Institute, March 21.—Mr. J. F. Bateman, F.R.S., read a paper on meteorology, in which he analysed the causes of a variation of rainfall in the United Kingdom. In the discussion special remarks were made as to the causes and effects of the almost tropical rainfall that once obtained in these islands; after which a paper on Indian rain-seedings it was announced that Prof. Balfour, F.R.S., would read a paper on the visible universe at the next meeting.

EDINBURGH

Royal Society, March 7.—Lord Moncrieff, president, in the chair.—The President read the second part of his paper on the rise of the constitutional idea. In the half-century that elapsed after the publication of Buchanan's "De Jure Regni apud Scotos," important political changes were taking place and were shaping themselves, under the skilful hand of James VI. of Scotland, especially after his accession to the English throne, towards a despotism that would place the king alongside the arbitrary monarchs of the Continent. Charles I. however lacked the kingcraft to carry on successfully this policy of diminishing the power of the Parliament; and in 1644, in the heat of the contest between King and Commons, Samuel Rutherford published his "Lex Rex," which contains the first enunciation in the English language of the true *rationale* of the British Constitution. Passing on to the time of the Commonwealth, his lordship touched on the famous controversy on the divine right of kingship between Salmasius and Milton, a controversy which was continued by Hobbes and Harrington. Lastly, the paper discussed Algernon Sidney's work on Government, which was characterised as out of sight the best and ablest of the list.—Dr. D. J. Cunningham, in a paper on the intrinsic muscles of the mammalian foot, gave an interesting account of several of the most striking modifications that occur in the arrangement of these muscles in different animals. The typical arrangement of three layers of four muscles each was found in certain marsupials, and the deviations from this typical arrangement could be grouped in two classes—those that resulted from division, and those that resulted from fusion. The peculiar modifications in the ox, horse, ape, baboon, gorilla, and man were specially referred to, many of these deviations being of the nature of degeneration or retrograde development.—Mr. A. H. Anglin communicated a paper on the expansion of rational fractions.—Dr. A. Macfarlane, in his third paper on the algebra of relationship, showed the nature of the problems that came under the scope of his symbolic method.—Prof. Tait communic
on a problem in kinetics of peculiar difficulty. C
equal masses, originally balanced on an Atwood's
set oscillating through a small arc. What is the
motion? The equations of motion are peculiarly
but may by suitable transformation be thrown into
which may be derived by simple inspection the po
that the oscillating mass moves under the action of
acceleration, so that the mixed potential and kin
tend to become altogether kinetic. When both m
oscillating, a further complication is of course intr
it is found that the mass that is oscillating through
angle is subject to a downward acceleration.

VIENNA

Imperial Academy of Sciences, March 1
in the chair.—C. Ludwig, studies made at the
Institute at Leipsic during the time of 1879-80.—
mann, enunciation of formulæ useful for determinin
of diamagnetism.—Dr. Synas Klemencic, relating
mination of the proportion of the magnetical to
unit of the intensity of circuit.—Dr. F. Streintz,
tion of water on platinum-electrodes caused by the
Leyden-jars.—E. Ratkay, on *Exoascus Wiener*
Edm. Reitlinger and Dr. F. Woechter, on the "dis
electrodes by positive electricity and explanation
of Lichtenberg.—Dr. P. Weselsky and R. Benedi
packet containing the description of some new dye
—Josef Wentze, on the flora of the Tertiary distr
Sulloditz (Bohemia), central chain of mountains.—F
on the oxidation of Borneolacetate.—E. Stefan,
brium of a solid elastic body at a different or var
ature.—Dr. Ernst. v. Fleischl, physiologico-optic
Puluj, on radiant electrode-matter (third paper).

LIGHTNING CONDUCTORS.

Experience, accumulated since the time of Benjamin Franklin, proves conclusively that a Conductor made of Copper of adequate size is the best of all appliances for the protection of every description of building from the destructive effects of lightning.

NEWALL & CO.'S
PATENT COPPER LIGHTNING CONDUCTOR,

As applied to all kinds of Buildings and Shipping in all parts of the world with unvarying success; is the most Trustworthy, most Effective, and also the Cheapest Conductor ever offered to the public.

It is simple in its application, no insulators being required, and it costs only one shilling per foot for the standard size, which ensures safety in any storm.

ISLAND LIFE:

OR, THE PHENOMENA AND CAUSES OF INSULAR FAUNAS AND FLORAS, INCLUDING A REVIEW AND ATTEMPTED SOLUTION OF THE PROBLEM OF GEOLOGICAL CLIMATES. By ALFRED R. WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c.

"Mr. Wallace discusses in an admirably clear and able manner the questions of geological climate and time . . . only a few of the great problems discussed in this most instructive volume—a volume that ought to interest every thoughtful While its theories are likely to meet with keen criticism from Mr. Wallace's fellow-scientists, his volume ought more than we know of to spread among the intelligent reading public a knowledge of and interest in some of the most momentous problems of our time."—*Times.*

"His wonderful grasp of detail, depth of insight, and breadth of view remind one at every turn of Darwin, with shares the honours of discovery in the theory of natural selection; but beyond this he has a lightness of touch, a beauty and an ingenuity in unravelling intricate difficulties which are all his own. . . . 'Island Life' is a work to be accepted without reservation from beginning to end. . . . Whoever reads his book must be charmed with it."—*St. James's Gazette.*

"The work throughout abounds with interest. . . . It may be read with equal pleasure by those who are already acquainted with the general principles of distribution and by those who wish for the first time to learn something about modern geography."—*Athenæum.*

"We have said enough to show that Mr. Wallace is led to discuss subjects of great interest to speculative minds. The numerous special maps 'Island Life' ought to prove as interesting as it is instructive."—*Pall Mall Gazette.*

VOL. I.—SHORTER ENGLISH POEMS. **12s. 6d.**
VOL. II.—ILLUSTRATIONS OF ENGLISH RELIGION. **11s. 6d.**
VOL. III.—ENGLISH PLAYS. **11s. 6d.**
VOL. IV.—SHORTER WORKS IN ENGLISH PROSE. **11s. 6d.**
VOL. V.—LONGER WORKS IN ENGLISH PROSE. **11s. 6d.**

"The plan of this valuable publication differs considerably from that of previous works of its class, and its survey of the field of English L is certainly *far more searching and extensive than anything to be met with elsewhere.* Among the most striking features of the contr handsome volumes are the freshness of matter selected and the intrinsic interest of the woodcuts, which are all of them authentic."—*Daily Ne*

NATURE

A WEEKLY ILLUSTRATED JOURNAL OF SCIENCE

"To the solid ground
Of Nature trusts the mind which builds for aye."—WORDSWORTH

NO. 596, VOL. 23] THURSDAY, MARCH 31, 1881 [PRICE SIXPENCE

Registered as a Newspaper at the General Post Office.]

[All Rights are Reserved.

OCIETY FOR THE ADVANCEMENT OF CHEMICAL INDUSTRY.

A Meeting for the purpose of forming a Society for the Advancement of emical Industry will be held on MONDAY, April 4th, 1881, in the rooms the Chemical Society, Burlington House, Piccadilly, London, W., at 4 1.

Prof. ROSCOE, F.R.S., President of the Chemical Society, will occupy chair.

All persons interested in the Chemical Industries are hereby invited to end.

GEORGE E. DAVIS, Hon. Sec. *pro tem.*

UNIVERSITY COLLEGE, NOTTINGHAM.

The Town Council of Nottingham have resolved to APPOINT FOUR ROFESSORS as follows:—

ONE PROFESSOR who shall undertake one or more of the following bjects:—Classics, Literature, History, Political Philosophy, Moral Science; d

THREE PROFESSORS who shall each undertake one or more of the llowing Subjects:—Mathematics (including Theoretical and Applied echanics), Physics, Chemistry, Physiology, Biology, Geology.

The work of the College will be divided into FOUR DEPARTMENTS, whose rangement will depend to some extent on the subjects undertaken by the rofessors elected, but it is intended that the three Scientific Departments all severally comprehend—

1. Mathematics and Mechanics,
2. Chemistry,
3. Natural Science,

nd that the subject of Physics shall be placed as a subject of principal mportance in one or other of those Departments.

Applicants are invited to specify the subjects which they would be pre- ared to undertake. Applications for the above Appointments to be ad- ressed to the Town Clerk, Municipal Offices, Nottingham, endorsed "University College," on or before the 7th day of May next. Particulars f Salaries, Duties, and Conditions will be sent upon application to the own Clerk.

Candidates are especially requested to abstain from canvassing.

SAM. GEO. JOHNSON, Town Clerk.

Municipal Offices, Nottingham, 22nd March, 1881.

THE COUNCIL OF FIRTH COLLEGE,

SHEFFIELD, intend to APPOINT a PRINCIPAL, who shall also be Professor either in the Literary or in the Mechanical Department of the College.

These Departments will comprehend respectively the following Subjects:—

1. Classes, History, Literature, Political Economy, Moral Science.
2. Mathematics, Mechanics, Engineering, Geology, Physics.

Applicants are requested to state in which of these Departments they would be prepared to act as Professor, and which of the Subjects in that Department they would be prepared to undertake.

The Salary of the said Principal will be £500 per annum, with Half the Fees of his own Classes.

The Council will only make the Appointment in event of suitable Candidates presenting themselves.

Candidates are requested to give full particulars concerning Age, Experience, and any Academical Distinctions they may have gained, together with any other information likely to affect the decision of the Council. The names of three gentlemen to whom references may be made should be given, but no testimonials need be sent unless they are asked for.

Applications to be sent on or before the 25th day of April next, to

ENSOR DRURY, Registrar.

Firth College, Sheffield, March 24, 1881.

BROWNING'S BINOCULARS.

The "Panergetic" Opera, Field, and Race Glass,

For general use, brilliant light, extensive field of view, and sharp definition.

"Brings out figures with marvellous distinctness, and has a very large field of view, and so many advantages over the other Binoculars that we have seen, that we confidently award very high praise indeed."
Popular Science Review.

PRICE £4 10s., £5 10s., and £6 10s.

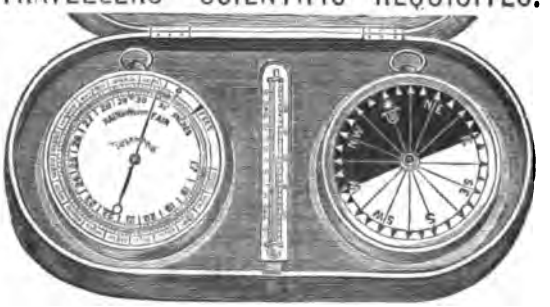
ILLUSTRATED LIST FREE BY POST.

JOHN BROWNING,

Optical and Physical Instrument Maker to H.M. Government,

63, STRAND, LONDON, W.C.

TRAVELLERS' SCIENTIFIC REQUISITES.



ANEROID BAROMETER with ALTITUDE SCALE, THERMOMETER and COMPASS in Flat Pocket Case, various Forms,

£7 7s. and £8 8s.

Price Lists of Instruments free by post.

NEGRETTI & ZAMBRA,

Opticians and Scientific Instrument Makers

To HER MAJESTY THE QUEEN,

HOLBORN VIADUCT,

45, CORNHILL, & 122 REGENT STREET, LONDON.

MICROSCOPIC OBJECTS

Of superlative perfection, illustrating Histology and every branch of Microscopy.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48N, Tollington Road, Holloway, London, N.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The SUMMER SESSION will commence on May 2nd. Students entering in summer are eligible to compete for the Natural Science Scholarships of £100 and £60 awarded in the following October.

Special Classes are held for the Matriculation, Preliminary Scientific, and 1st M.B. of the University of London.

There are numerous Prizes and Scholarships, and all Appointments are open to Students without extra payment.

Several Medical Practitioners and Private Families in the neighbourhood receive Students for residence and supervision, and a register of inspected lodgings is kept in the Secretary's office.

Prospectuses and all particulars may be obtained from the Secretary, Dr. Gillespie.

W. M. ORD, M.D., Dean.

SOLAR PHYSICS.

The following COURSE of LECTURES will be given by Members of the Committee on SOLAR PHYSICS, appointed by the Lords of the Committee of Council on Education:—

An Introductory Lecture. By Prof. STOKES, Sec.R.S. 6th April, 1881.

A Lecture on the Practical Importance of Studying the Influence of the Sun on Terrestrial Phenomena. By Lieut.-General STRACHEY, R.E., C.S.I., F.R.S. 8th April.

Two Lectures on the Connection between Solar and Terrestrial Phenomena By Prof. BALFOUR STEWART, F.R.S. 27th and 29th April.

Six Lectures on Spectroscopy in Relation to Solar Chemistry. By Mr. J. NORMAN LOCKYER, F.R.S. 4th, 6th, 11th, 13th, 18th, and 20th May.

Three Lectures on the Photography of the Infra-red of the Spectrum in its Application to Solar Physics. By Capt. ABNEY, R.E., F.R.S. 25th and 27th May, and 1st June.

The LECTURES will be delivered in the Lecture Theatre of the South Kensington Museum at 4 p.m. on the days stated above.

Admission will be by Tickets, which may be obtained, as far as there is room, on application by Letter to the SECRETARY, Science and Art Department, South Kensington, S.W.

LONDON UNIVERSITY, ARMY, CIVIL SERVICE.

Dr. R. H. JUDD, D.Sc. (Lond.), M.A. (Cantab.), High Wrangler, First Class Natural Science Tripos, late Scholar of Christ's and sometime Demonstrator of Chemistry at Caius College, Cambridge, with qualified Assistants, prepares Gentlemen in all the subjects for the above Exams.

Natural Science treated both experimentally and theoretically.

Highest Testimonials and References to present and former Pupils. A few Pupils taught by Correspondence. Special Classes now forming for Matriculation, B.A., B.Sc., and Prel. Sci.

119, Cambridge Gardens, Notting Hill, W.

ROYAL POLYTECHNIC.—CLASSES for

the Preparation of Students for University Examinations, under the direction of EDWARD B. AVELING, D.Sc., F.L.S. London University Matriculation, 1st and 2nd B.Sc., Preliminary Scientific M.B., Botany, Physiology, Chemistry. All the work practical.

B.A. (High Honours), F.L.S., requires a

SCIENTIFIC POST. Exceptional References.—Address B.A., NATURE OFFICE.

INSTRUCTION IN MATHEMATICS.—

Youths or Adults attended at their Residence, on Reasonable Terms, by a M.A. of Cambridge. Unquestionable references if required.—Address, by letter, O. P., Post Office, Turnham Green.

WANTED.—NATURE at HALF PRICE,

three or four days after publication. A Permanency probable.—Address P. E., care of Messrs. Dawson and Sons, 121, Cannon Street, London, E.C.

EVERY BOY A GEOLOGIST.

Now ready, and highly recommended, complete, price 7s. 6d.

This admirable little Work and most extraordinary Cabinet of wonderfully well-selected Natural Specimens, together with other Geological Preparations, and a powerful LENS, are calculated to start a boy thinking till he has mastered for himself no ordinary knowledge of the formation of the Earth's Crust.—THOMAS J. DOWNING, GEOLOGIST, &c., 38, Whiskin Street, London, E.C.—Catalogues free.

DIAMONDS IN MATRIX.

R. C. NOCKOLD, Diamond and Oriental Stone Cutter and Dealer, has for sale Specimens of the above; also Cut Precious Stones in all Colours.

Precious Stones valued and bought.

THE ZOOLOGIST:

A MONTHLY MAGAZINE OF NATURAL HISTORY.

Third Series. Edited by J. E. HARTING, F.L.S., Member of British Ornithologists' Union; contains—

Original articles by well-known naturalists in every branch of the habits of animals; arrival and departure of migratory birds; occurrence of rare birds; distribution and migration of British fresh-water fish or rare marine fish; local aquaria; British reptiles; British land- and water mollusca, with remarks on the haunts and habits of the species; other matters of general interest to those who delight in nature. Reports of the Linnean, Zoological, and Entomological Societies. Reviews of natural history books. Occasional translations from foreign works and journals of important and interesting articles in various branches of zoology. There are occasional woodcuts.

JOHN VAN VOORST, 1, Paternoster Row.

"The leading Farmers' paper."—CLARE SEWELL READ, Esq., M.P.

THE CHAMBER OF AGRICULTURE JOURNAL AND FARMERS' CHRONICLE

(PRICE 3*d.* WEEKLY).

The representative organ of the Central and Provincial Chambers of Agriculture; *gives fuller reports of the discussions and proceedings* at this extensive organisation than any other agricultural paper; pays *special attention to the treatment of Agricultural Questions by Parliament*, besides containing ample Reports of the LATEST LONDON COUNTRY CORN, CATTLE, HOP, PROVISION, and other Markets, with Original Articles on Practical Farming, the Dairy, Herd and Flock, News, Horticulture, &c., &c. It is despatched every Monday evening in time for the country post.

Terms of Subscription, payable in advance, post free:—3 months, 3s. 3d.; 6 months, 7s. 7d.; 12 months, 15s. 2d.

Published by W. PICKERING, 21, Arundel Street, Strand, London.

On the 1st of every Month, price Sixpence.

The Institute has been established to ensure that consulting and analytical chemists are duly qualified for the proper discharge of the duties they ertake by a thorough study of chemistry and allied branches of science, in their application to the arts, public health, agriculture, and technical industry. The Members of the Institute are divided into two grades, having the distinguishing ranks or degrees of Fellow and Associate respectively. In the case of a Fellow, the Council requires that the Candidate should have been admitted to the Institute as an Associate, and that since his admission for a period of three years therefrom he should have been continuously engaged in the study and practical work of Applied Chemistry in a manner ifactory to the Council.

In the case of Associates the present regulations require every applicant for admission to this grade to submit to a stringent examination in practical nistry, and to show to the satisfaction of the Council that he has passed through a course of three years' study of theoretical and analytical chemistry, sics, and elementary mathematics. An Associate must be at least 21 years of age before admission, and is not eligible for the higher rank of Fellow until nas been continuously engaged for three years in the study and practical work of Applied Chemistry, in a manner that shall be considered satisfactory by Council.

LA SEMAINE FRANÇAISE.—"'La Semaine Française' has been brought out in London for the benefit of those English readers who may wish to study contemporary French from all points of view, instead of confining their reading to one particular Gallic print. It certainly merits success."—*Graphic.*

LA SEMAINE FRANÇAISE.—"The numbers before us are full of good things. . . . . It will be far better for most that any one of the best papers published in Paris itself. We are much pleased with the character of it, and believe it will be highly valued in all those many households where French is cultivated. The printing is very well done."—*Queen.*

his of the book is devoted to ants
ion constitutes a compendium of
hology of these interesting animals
y Büchner inserts in accordance with popular

which we do not hesitate to regard as the most instructive that has hitherto been made. There are however no original observations in the book—or rather no original observations recorded as made by Büchner himself, for there are several highly interesting observations recorded as made by friends and correspondents. Some of the more important of these we may here present.

Herr Lehr, a "bee-keeping friend of the author," noticed that when his bees were attacked by dysentery, and "no longer able to retain their excrements, one hive suffered less than the others." Investigation showed that the bees of this hive had made a drain from the upper part of the hive, "where they were accustomed to sit together during the winter," to the exterior.

The same (?) friend observed that when the wind blew down one of his hives and he replaced it, a few days later "the bees had left their old home in the lurch, and tried to enter other hives, clearly because they could no longer trust the weather, and feared that the terrible accident might again befall them."

Another friend, Herr Schlüter, saw a hornet catch a cicada, sting it, and try to fly off with the bulky prey. The hornet's strength not being sufficient to enable it to fly with the cicada from the ground, it dragged its burden up the stump of a mulberry-tree that stood close by. Arrived at the top of the stump—twelve feet from the ground—"it rested for a moment, grasped its victim firmly, and flew off with it to the prairies. That which it was unable to raise off the ground it could now carry easily once high in the air."

Again, Herr Merkel communicates the following. He saw a little grey wasp dragging a long caterpillar to its hole. Arrived there, it put one end of the caterpillar over the hole, "and went to the other end and lifted it up so high that the caterpillar fell in. But a piece of it stuck out"; so the wasp pulled it out, and, laying it down near the hole, "went in again and brought out several little stones of the size of small peas. It then again let the caterpillar fall into the hole in the way described." This time it was quite absorbed by the hole, and was buried by the wasp.

More interesting is an observation due to Herr Nottebohm, Inspector of Buildings at Karlsruhe, who carefully syringed off all the aphides from a weeping-ash in March, to the great benefit of the tree. But in June he was astonished to see multitudes of ants running up and down the trunk of the tree, busied in carrying up aphides all over the tree in order to re-stock it, and "after some weeks the evil was as great as ever."

Again Herr Theuerkauf showed Büchner a maple tree, round which he had "smeared about a foot width of the ground with tar," in order to check the mischief caused by ants cultivating aphides. But the ants on the tree turned back on finding the tar, and "carried down aphides, which they stuck down on the tar one after another, until they had made a bridge over which they could cross the tar-ring without danger."

Highly interesting also is an observation communicated to the author by Herr Krepin concerning the Ecitons crossing streams, which is even more wonderful than anything that has been related of these wonderful insects by Bates or Belt. "If no natural bridge is available for the passage, they travel along the bank of the river until they arrive at a flat sandy shore. Each ant now seizes a bit of

dry wood, pulls it into the water, and mounts thereon. The hinder rows push the front ones even further out, holding on to the wood with their feet and to their comrades with their jaws. In a short time the water is covered with ants, and when the raft has grown too large to be held together by the small creatures' strength, a part breaks off and begins its journey across, while the ants left on the bank busily pull their bits of wood into the water and work at enlarging the ferry-boat until it again breaks. This is repeated as long as an ant remains on the shore."

Similarly, Dr. Ellendorf informs the author that he has witnessed ants using a straw for a bridge across a saucer of water which he had placed as a barrier between the ants and his provisions. He then pushed the straw about an inch from one of its two landing-places. After much confusion and crossing of atennæ, the ants "soon found out where the fault lay, and with united forces they quickly pulled and pushed the straw until it again came into contact with the wood, when the communication was again restored."

The same observer communicates another very interesting observation on the leaf-cutting ants. He interrupted a marching column by placing a withered branch across their road. The loads were laid aside by more than a foot's length of the column, and the ants began on both sides of the branch to tunnel beneath it, and when the tunnel was completed "each ant took up its burden again, and the march was resumed in the most perfect order."

These being the most important additions which Prof. Büchner's work has made to our previous knowledge of insect psychology, we shall now proceed to make a few criticisms upon the work as a whole. In the first place, the author is not quite free from the failing common to less critical writers on animal intelligence, of admitting dubious cases without sufficient reserve. Thus, for instance, on no better authority than Plutarch, he gives (p. 57) a case "related by a certain Cleanthes," of ants going from one ant-heap to the entrance of another, carrying a dead ant. Other ants came out of the visited heap, consulted with the bearers of the body, went back again and brought a worm "out of the depths of the nest, which was evidently intended to serve as a ransom for the dead body. Then the ants which had brought the corpse left it lying there, and carried away the worm instead." He then adds, "However incredible this may sound, it is beyond doubt that ants and bees have been seen carrying away and even burying their dead, and of this further details will be given later." As the fact of "burying" is highly dubious, we looked forward from this statement to afterwards meeting with some new evidence upon the subject; but in the case of ants only found the unsupported assertion of Dupont, followed by a confusion of the well-ascertained fact that ants carry their dead away from their nests, with the inference that they bury them (p. 167), while in the case of bees we only met with (p. 249) a very flimsy anecdote, which we had previously read in Watson's "Reasoning Powers of Animals," quoted from the *Glasgow Herald* on the authority of an anonymous correspondent; it presents a pathetic account of two bees flying out of a hive "carrying between them the corpse of a dead comrade," till, after searching for a suitable hole, they "carefully pushed in the dead body, head foremost, and finally placed above it two small stones. They then watched for about a minute before they flew away, doubt, of course, performing some appropriate service. And this is the evidence on which the statement rests, "*it is beyond doubt* that ants have been seen . . . burying their dead"! Such of careless judgment, however, in admitting alleged on wholly inadequate evidence, are fortunately work exceptional.

Another point on which criticism has to be the frequent failure of references. Important constantly stated without any information being as to the authority on which the statements rest even when the authority is stated, after the first quoting the reference is always to *loc. cit.*, so the name of the work is carried in the reader's he has to hunt back through an indefinite pages of letterpress till he finds it.

Another feature of the work which must be a blemish upon it as a work of science, is a breaking out of allusions to matters religious and The strong bias which the author displays in the sions, apart from being singularly out of place in which aims at scientific method, constantly into obvious fallacies. For instance, when speaking ants, he asks, "Why should we take it for granted a perfectly free community men would only work pelled, when these animals give proof that such commonwealth is very possible, and is compatible the voluntary work of all?" Certainly any one disposed to take such a supposition for granted scarcely be convinced by such a false analogy between an ant and a man; and he might well show up the nonsense by replying, "Why should it for granted that men in a perfectly free *would* work without compulsion, when the ants give proof that such a free commonwealth is very and is compatible with no work at all?" So logic of many of these passages, and we do that in others of the same kind the sentiments more fortunate. It is, for instance, to be doubted the following picture of "the widest Socialism munism" as revealed in bees, and held out as for humanity to imitate, will prove as attractive eyes of all his readers as it evidently appears to of the writer. "They have no private property family, no private dwelling, but hang in thick within the common-room in the narrow space the combs, taking turns for brief nightly repose On all such matters opinions may legitimately allusions to them are, as we have said, out of treatise on Comparative Psychology.

Coming next to criticisms of a more purely character, we have first to notice a meagre which the whole subject of instinct is treated anxiety to combat the supernaturalists, Büchner the side of too closely assimilating the psychic faculties of insects with those of men. That is endeavours to explain most, if not all, instinctive as being one with "reason" and "reflection." an enormous and damaging mistake in the evolution to disparage the distinction which unably exists between mind in animals and mind The function of an historical psychologist is to

GEORGE J. ROMANES

AMERICAN INDIAN LANGUAGES

Introduction to the Study of Indian Languages. By J. W. Powell. Second Edition. (Washington: Government Printing Office, 1880.)

THIS is one of the most useful of the many useful works issued under Mr. Powell's able management by the ethnological bureau of the Smithsonian Institution. It was originally published in 1877, and it is satisfactory to find that another edition has so soon been called for. At the same time one cannot but regret that this opportunity was not taken to somewhat modify the title, which, as it stands, is apt to deceive the unwary. The book is in no sense an abstract treatise on the nature, structure, or classification of the American languages, either regarded independently or in relation to other forms of speech. It has nothing to do with the philosophy, or even with the grammar of these idioms taken collectively or individually. Its object, if less ambitious, is perhaps far more useful in the present state of these studies. American philologists have confessedly shown a disposition to dogmatise on the morphology of the native idioms, and have indulged in some very wild speculation on utterly insufficient data regarding their origin, development, and affinities. The old school of etymologists, who held that Eliot's Massachusetts Bible was merely a thinly disguised form of Welsh, that Delaware and Lapp were first cousins, and that Basque sailors stranded on the Brazilian seaboard could hold converse with the Tupinambas and other Guarani peoples of that region, has had its day. But it has been succeeded by another, which, if slightly more cautious, is scarcely less extravagant, and which, notwithstanding the warning voice of science, still flourishes in both hemispheres. It will suffice here to refer to the astonishing theories seriously advocated by the late Abbé Brasseur de Bourbourg on the relations of the Maya-Quiché and Aryan families, by the Abbé Petitot on the Athabascan and Chinese, and quite recently by Mr. John Campbell of Montreal on "The Hittites in America." "The Aleutians and Barabra," writes the last-mentioned authority, "agree in being worshippers of the sun like other Hittites, in the manufacture of red waterproof leather, and in their manner of adorning the head. . . . Physical ethnology would never have dreamt of uniting white Basques and Circassians, black Nubians, yellow Japanese, and red American Indians; but philology, which knows no colour but that of words and constructions, makes them one. It may be that in the Barabra we shall yet find the purest surviving form of the ancient Hittite language. Some of its numerals help to connect those of the Peruvian dialects with other Hittite forms." One thing more surprising perhaps than such insanities is their appearance in the pages of a professedly scientific journal (*The Canadian Naturalist and Quarterly Journal of Science* for August, 1880, p. 359).

A wholesome check to writers inclined to indulge in tendencies of this sort is afforded by the modest and unpretending character of the work under consideration. It is put forward simply as a guide and aid to students in the collection of linguistic materials in a very wide field, where the labourers are still too few for the urgent and extensive character of the work to be performed. It thus brings us back to the domain of hard facts, wisely

reserving all speculation for a time when these facts will have been accumulated in sufficient number to afford a sound basis for more general inductions. "The book is a body of directions for collectors" (Preface vi.). It is divided into three chapters, one "On the Alphabet," another containing "Hints and Explanations," and a third supplying a large number of forms or "Schedules" to be filled up by the collector. The chapter on the Alphabet aims at establishing some uniform system of spelling for all the native tongues, and puts forth a comprehensive scheme embodying many useful suggestions well deserving the attention of our "spelling reformers." These are summed up in a few fundamental rules, the chief of which are the exclusion of all characters and diacritical marks except those found in ordinary English printing offices, and the restriction of each sign to a single sound. The difficulty of adapting the Roman system to the Indian tongues will be understood when it is stated that "there are probably sounds in each which do not appear in the English or any other civilised tongue; and perhaps sounds in each which do not appear in any of the others, and further, that there are perhaps sounds in each of such a character, or made with so much uncertainty, that the ear is unable to clearly determine what these sounds are, even after many years of effort" (p. 2). Nevertheless the difficulty is manfully faced and largely overcome by the scheme here adopted, which is founded on one originally proposed by Prof. J. D. Whitney, and which is consequently at once scholarly, simple, and comprehensive. A few improvements might here and there be suggested, but on the whole there is little to complain of, except perhaps the use of the circumflex (^), to mark both a long *a* sound, as in *all*, and a short *u* sound as in *but*. Some confusion is caused by an awkward misprint at p. 5, where this û appears instead of the German *ü*. It might also perhaps be better to indicate excessive vowel length by doubling the vowel as in Dutch, than by the clumsy addition of the sign +. Thus *maan* rather than *ma* + *n*.

Chapter II. contains a number of well-digested and tersely-expressed remarks on dress, ornaments, dwellings, implements, food, colours, plants, animals, medicine, social organisation, kinship, government, and many other topics, which at first sight seem to have little connection with the subject of American philology. But the author has wisely endeavoured thus "to connect the study of language with the study of other branches of anthropology; for a language is best understood when the habits, customs, institutions, philosophy—the subject-matter of thought embodied in a language are best known. The student of language should be a student of the people who speak the language; and to this end the book has been prepared, with many hints and suggestions relating to other branches of anthropology" (Preface vi.). But besides these matters the chapter contains what will be welcomed as a boon by all linguists, a reprint of J. H. Trumbull's masterly paper "On the Best Method of Studying the North American Languages," originally published in the *Transactions* of the American Philological Association, 1869-70, but strangely neglected by many subsequent writers on the subject. No other treatise perhaps of equal length contains so clear and philosophic an account of the peculiar genius and morphology of these polysynthetic tongues. A great deal devoted to the question of kinship, the true ba tribal society, and this intricate subject is full by a series of four "kinship charts" or diagrams, which the original investigator will greatest service in collecting and arranging h The general student will also find them extr in comparing the American systems of family with those prevalent especially amongst th of the Deccan and the Australian aborigines importance has perhaps been attached to res this sort in tracing racial affinities; but thei in the history of the evolution of huma undeniable. Connubial society develops society, or the clan, in which all the membe relations, whence the tribe and nation. It i that the connubial, or lowest form, still so many parts of the eastern hemisphere, se long disappeared, at least from the northern New World, although some of its custom those associated with kinship, still survive advanced tribal state. This explains the ba of family nomenclature with which the Indi are still encumbered. In the printed forms, of which Chapter III. exclusively consists, relationship occupy about forty pages, hundreds of complicate affinities such as, elder brother's daughter's daughter's daughte "my father's mother's brother's son's son" "my mother's father's brother's son's daught daughter," "my mother's mother's sister son's daughter's daughter," "my mother's daughter's daughter's daughter's husband," and even more intricate degrees of parentag tongues supply equivalents, which the accordingly required to discover and insert columns prepared for the purpose in the sch arrangement of the other matter contai schedules seems to be somewhat needlessly least the advantages are scarcely so obvious venience of breaking up the strictly lexi upwards of twenty sub-headings, instead of whole in one general vocabulary arranged a Experience has abundantly shown how t the use of such minutely-classified lists of w the compiler. This remark does not of co the lists of sentences (Schedules 26-9), whi have been carefully prepared, and are w to bring out the structure and varied gramm of the Indian languages.

hat staggering to learn (NATURE, vol. McLeod, with his well-known experi- hitherto failed to repeat the experiment, above zero;[1] but I take this as an ose rare cases where refined experi- tructions rather than aids, for I believe due to the fact that Prof. McLeod's ret, and the evaporation therefore so ot have a fair chance of showing its erature; it could not in fact get even if Prof. McLeod will discreetly spoil ssure is only just below the vapour- the temperature shown by his thermo- ; that he will see the ice rise to any

[1] I am received, by the kindness of M. Boutlerow, bef re the St. Petersburg Academy of Sciences, ers which have appeared on the subject, relative eriment, and confesses himself a sceptic. It M. Boutlerow's carefully-wrought memoir to is my impression that his failure is due to the ve ventured to suggest above as accounting for ct apparatus and too great experimental skill.

temperature he likes, and he will find that when it is crossing zero it will be utterly regardless of the fact.

The same kind of statement applies to solid carbonic acid, on which I have made a few experiments with a view to raising its temperature. I squeezed it into the ice form in a hydraulic press (to diminish the evaporating surface), put a thermometer in it, and held it over a fire. The evaporation is so excessively rapid, however, that it remains apparently just as cold as before.

I have not time to follow it up just now, but the obvious thing is to put it under pressure, so as to diminish the rate of evaporation, and then heat it. Prof. McLeod informs me that the boiling-point of CO_2 continues below its melting-point (which is given by Frankland as $-57°$ C.), until the pressure is four atmospheres; so that anything just under four atmospheres may be applied to this substance with impunity, and it will then be exactly in the most favourable condition for the Carnelley experiment; and I have not the slightest doubt that it can then be warmed, and if at the same time the pressure be judiciously and gradually increased, that it can be made as warm as one pleases until it has all disappeared.

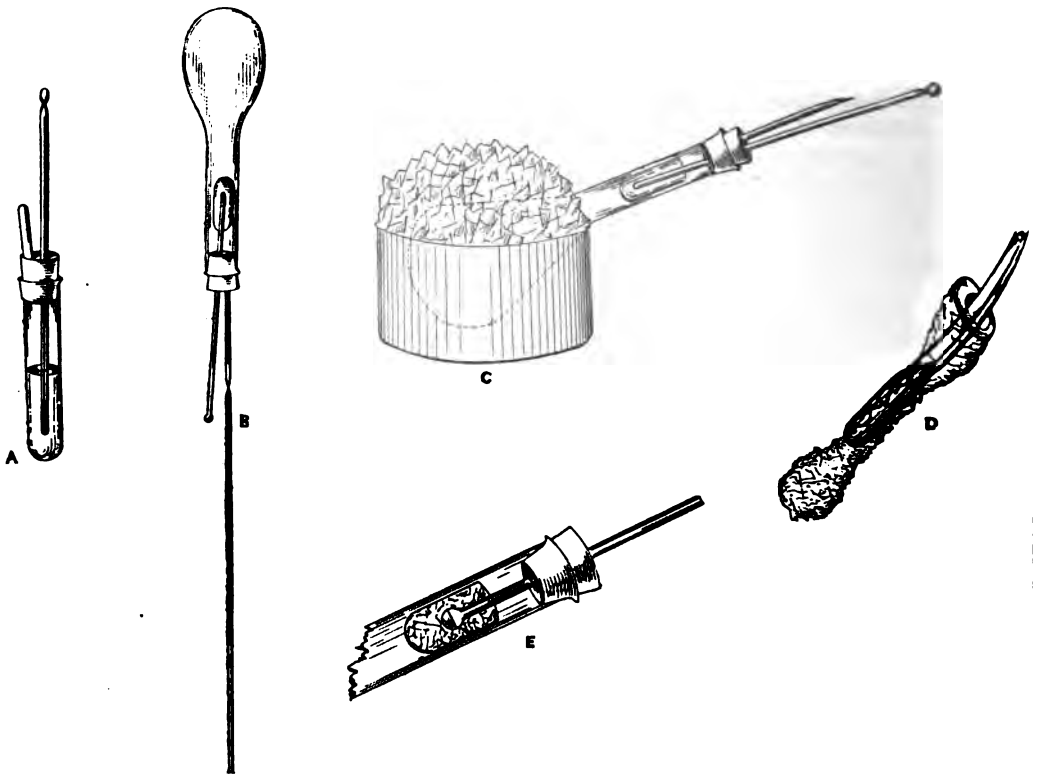
Experiment with substances other than water however are likely to be more difficult, simply because few substances have such a large latent heat both in the liquid and gaseous condition, and therefore few substances will be anything like so permanent and outlive the evaporation so long. OLIVER J. LODGE

17, Parkhurst Road, N.

THE announcement made some time since by Dr. Carnelley that ice *in vacuo* could be raised to a temperature far above its ordinary melting-point, seemed so thoroughly in opposition to the experience derived from the great work of Regnault on the tensions of vapours; and as it called for a complete change of ideas in a field in which I am much interested, and as Dr. Carnelley asked others to repeat his experiments, I was induced to examine for myself the experiments on which so curious a statement was founded.

I used two different methods: the Torricellian vacuum and the Sprengel vacuum. As the experiment, as conducted by the Torricellian method, can easily be repeated by any one, and is much simpler in form than Dr. Carnelley's, I shall detail it. In the first place I wished to obtain a clear continuous piece of ice round the thermometer, as Dr. Carnelley's method gave flaky ice, which I found might lead to errors, owing to its discontinuity leaving the thermometer bare in parts. To obtain clear ice the following method was used:—Some distilled water was boiled in a test-tube A fitted with a two-holed stopper, with a thermometer through one hole dipping into the water; when all the air was expelled, a glass plug was pressed into the other hole against the boiling steam, and the whole allowed to cool, and then frozen in a freezing-mixture. A long-necked "German Florence flask" was then rinsed with distilled water and filled with mercury, and also placed in a freezing-mixture. The tube A was then gently warmed with the hand, and the plug of ice adhering to the thermometer withdrawn. The glass plug in the second hole in the stopper was then replaced by a marine barometer-tube of about forty inches in length, having been drawn out about four inches from the top to facilitate sealing. The plug of ice round the thermometer was then inserted into the neck of the flask full of mercury, and the stopper pressed home. This caused the mercury to rise in the barometer-tube, and the whole was then inverted as at B; and when the mercury had all run out, the fall tube was melted through at the constriction B, leaving a Torricellian vacuum above. The flask was now laid on its side in a freezing mixture and well covered over with ice and salt as at C. After a few minutes, to allow the receiver to cool, heat was applied to the neck of the flask with a Bunsen lamp, and even with a blowpipe, till the glass softened, but the temperature of the thermometer did not rise until some part of it became denuded of ice, or until air had been admitted. The experiment was repeated again and again, but in no case while the vacuum was intact could the temperature of the ice be raised materially above that of the receiver. If the temperature of the receiver was $-12°$, then the ice was a little over $-12°$, say about $-11°$, but never more than two degrees above the receiver, although the glass almost in contact with the ice was at its softening point. This is exactly what we would expect from Regnault's experiments; the temperature of the receiver determines the vapour-tension, and therefore the "boiling point" of the ice. The ice was certainly never hot, and was not even

infusible, because when pressed against the hot glass it at once splashed out, freezing again in long thin flakes when it obtained free space for evaporation. All the heat passing to the ice is used up in volatilising it, and increase of the source of heat merely increases the rate of evaporation, as in the case of water boiling under atmospheric or other constant pressure; provided the condenser be efficient. These experiments were repeated with different thermometers and thicknesses of ice, varying from ½ inch to the thinnest film, $\frac{1}{10}$ inch, or thereby, and the temperature of the ice was always dependent upon the temperature of the receiver (when vacuous) and quite independent of the temperature surrounding it; the latter merely determining the rate of evaporation. Whenever a hole appeared in the ice covering the thermometer the latter rose, and if close to the bu rapidly. When the ice wore away, as shown at D, t ature registered by the thermometer could be made con under zero. If the source of heat was made to play of the tube, then the temperature would read over zero if made to play on the bottom it would read − 8°, the rea − 12°. When however the ice was made to lie on the of the thermometer by turning the latter round, the te could not be raised over zero, and sometimes not These experiments were repeated by exhausting with a pump, and it was invariably found that the pressure or vapour in the receiver determined the temperatu tilisation of the ice, and when the "vacuum" cou



water vapour the temperatures of the receiver and of the ice round the thermometer (however far apart they were placed) were practically the same. For instance, let the receiver be − 5°, then the thermometer in the ice is also − 5° or − 4°; now let the receiver be suddenly cooled to − 14° while the flame round the ice is urged to a higher temperature; the ice will nevertheless fall to − 13° or thereby; in short, the *temperature* of the "boiling" ice is determined by that of the receiver, while the *rate* of its "boiling" is determined by the temperature of the tube surrounding it. The ice remains perfectly dry, but if air be admitted or the receiver be raised above 0°, melting takes place.

As it has been objected that the thermometer might yield anomalous readings under such conditions (though why I cannot see), another method was tried, as shown at E. A small bulb blown on the end of a tube open at the other end, a little water, had ice frozen round it, as in the case mometer, and was then placed in the flask as bef there was a piece of ice under ordinary atmospheric co closed in the ice *in vacuo*. The tube round the outer raised to the softening point, but the ice in the bulb d and continued solid till the bulb was denuded of extern evaporation, showing that the ice *in vacuo* was never It appears then that ice cannot be raised above 0° circumstances, and that the pressure determines the or "boiling" points of both solids and liquids, as ha work would lead us to suppose.

J. B. Hay

Private Laboratory, Sword Street, Glasgow

BEING a reader of NATURE, I have become quite interested in Mr. Thos. Carnelley's experiments with hot ice. Although Mr. Carnelley's experiments would seem to be sufficiently accurate to prove that the ice was in a heated condition, I would still like to offer an additional method to heat the ice, and also a method to test for heat in the ice. To heat the ice I would suggest a small coil of fine platinum wire placed in position in the tube where the water is to be frozen, and the two ends of the coil passed through the sides of the tube and hermetically sealed.

If now the water be frozen around the coil, and a current of electricity passed through the wire of sufficient amount to heat the wire as much as might be determined upon, and the ice yet remain frozen, there would seem to be no doubt the ice having become heated by contact with the hot pl wire.

The method I would suggest to test for heat in the ice be to take a couple of pieces of heavy platinum wire and through the sides of the tube and hermetically sealed as except to have a small space between the two ends of the on the inside of the tube, of one-eighth or one-quarter inch as much space as might be thought best.

If now the water be frozen between the ends or all round ends of the wire, and a small battery and galvanometer in circuit with the terminals of the platinum wire, and a jet be applied to heat the ice, if the ice becomes heated

meter should show a stronger current of electricity pass-
the principle that most, if not all, non-metallic sub-
that are conductors of electricity become better conduc-
the application of heat. I judge that the galvanometer
uld be a very perfect one. GEORGE B. RICHMOND

The Oldest Fossil Insects

ALL be glad if you will afford me an opportunity of
ing one or two personal matters referred to in p. 11 of
udder's memoir on the Devonian Insects of New Bruns-
which was mentioned in your last number (pp. 483, 4).
ry justly takes exception to some bibliographical and
raphical errors committed by me in *Trans.* Entom. Soc.
1871, pp. 38-40, in a notice of fossil insects named and
ed by him, and naturally regards them as evidence of
ient study of the literature relating to them. It is difficult
precisely what happened upwards of ten years ago, but I
isfied that the mistakes must have arisen in one or the
of these two ways. Either I attributed the authorship of
mes to the person who first published figures of the fossils,
ground that names bestowed upon insect-fossils by the
ation of descriptions, without accompanying figures, rank
re "Catalogue" or MS. names devoid of priority; or else
re due to circumstances under which the citations were
ed. Closely pressed for time, and without much experience
art of citation, it is as likely as not that, after forming an
n upon the plates and consulting the letterpress to see what
thor had to say about them, I referred from force of habit
title-page of the volume for the date of publication and
thor's name, instead of turning to the heading of the article
is last.

the same page of his memoir Mr. Scudder alludes to the
wing passages in p. 39 of my work, over which we had
fun when he was last in England, though the strictures
not aimed at him more than at the others. "Palæon-
ists have adopted a ridiculous course with regard to some
t fossils. Whenever an obscure fragment of a well-reticu-
insect's wing is found in a rock, a genus is straightway set
nd the fossil named as a new *species*. The species is then
red to the *Ephemeridæ*, and is immediately pronounced to
synthetic type of insects at present distantly related to one
her in organisation. This enunciation of synthetic types is
nothing less than a resort to random conjecture respecting
ffinities of animals which the writer is at a loss to classify.
nsect allied to the *Ephemeridæ* which chirped like a locust
as *Xenoneura* is imagined to have been), is a tolerable
ple of these synthetic types. When a fossil comprises only
gment, or even a complete wing of an Ephemerid, it is
lly possible to determine the *genus*, and impossible to assert
species. The utmost that can be learned from such a speci-
is the approximate relations of the insect. Neuration by
f is not sufficient to define the species or even the genera of
nt *Ephemeridæ*." What I meant to be deduced from this
that, where in the nature of things actual precision is un-
inable, palæontologists should be content to learn and state
"approximate relations" of fossil insects, and not presume
n the ignorance of scientific men in the matter of *genera* and
ies. And I further thought that the *Ephemeridæ* had served
te long enough as an asylum for fossil cripples; I wished to
imate gently that refuse of other groups of insects should
henceforth "shot" elsewhere.

Mr. Scudder does not know by whom the Devonian insects
ave all been regarded as allies of the Ephemeridæ." My
thority for stating such to have been the case is Sir John Lub-
ck's Presidential Address in *Trans.* Ent. Soc. London, v.;
oc. cxxviii. (1868), where "*Haplophlebium Barnesii* . . . is
erred to the Ephemerina," and likewise "*Platephemera*
tiqua, *Homothetus fossilis*, *Lithentomon Hartii*, and *Xenoneura*
tiquorum" are said to be "all Neuropterous and allied to the
hemeridæ." As members of this family they are quoted by
arschall. *Dyscritus vetustus* was not cited by Sir John; but
ice Mr. Scudder now states it (p. 22) to be "most closely
lied" to Homothetus, there was no harm done in classing it
th the rest.

The reason why I thought, prior to the publication of Dr.
agen's letter in NATURE, that Platephemera might have been
Ephemeron, was that in some respects Mr. Scudder's figure
esents an appreciable likeness to the neuration of the fore-wing
in species of Palingenia, of which I possess unpublished drawings; but these certainly are not quite so odonatous in detail as Platephemera. Without inspecting actual specimens, it is hazardous to pronounce an opinion about fossils.

A. E. EATON

Chepstow Road, Croydon, S.W., March 28

Oceanic Phenomenon

FROM the description given by Dr. Coppinger of the "confervoid alga" observed on board H.M.S *Alert* some 200 miles to the southward of Tongatabu (NATURE, vol. xxiii. p. 482), the conferva in question would appear to be of a species similar to that from which the Red Sea is said to obtain its name. Whilst proceeding up the Red Sea in H.M.S. *Hornet* during the month of June of last year, I had many opportunities of observing the dirty-reddish scum on its surface—a phenomenon which must be familiar to all navigators of this sea. Each of the little bundles composing it measured about $\frac{1}{16}$th of an inch in length and $\frac{1}{100}$th in breadth, and contained from twenty to fifty filaments, each filament being composed of a linear series of short cells, and measuring $\frac{1}{3000}$th of an inch in breadth. I did not observe the discoid bodies referred to by Dr. Coppinger, but their absence may be explained by assigning to this conferva a particular season for the production of these bodies. Scattered among the bundles were tiny spherical bodies possessing a bristly appearance, which proved to be formed of a confused network of the filaments that composed the bundles.

This conferva would appear to have a very wide distribution. It was observed by Mr. Darwin near the Abrothos Islets which lie off the east coast of South America; and it is with regard to this phenomenon that the author of the "Journal of the *Beagle*" thus writes:—"Mr. Berkeley informs me that they are the same species (*Trichodesmium erythræum*) with that found over large spaces in the Red Sea, and whence its name of Red Sea is derived. In almost every long voyage some account is given of these confervæ. They appear especially common in the sea near Australia; and off Cape Leeuwin I found an allied but smaller and apparently different species. Capt. Cook in his third voyage remarks that the sailors gave to this appearance the name of sea sawdust."

The Banks of the Yang-tse at Hankow

AT the end of January, 1878, when the waters of the Yang-tse occupied their lowest level, I had the opportunity of examining the left bank of the river immediately below the foreign settlement. The bank, which varied from thirty to thirty-five feet in height, did not present a single perpendicular face, but was cut up into two or more terraces formed by the lingering of the waters at those levels for some extent of time. A calcareous loam, homogeneous in appearance and dark in colour, composed the entire bank with the exception of the upper portion, where a layer of sand a few inches in thickness separated two layers of laminated loam, each of them of similar thickness. After a little trouble I was enabled to observe that the apparently homogeneous loam was made up of fine horizontal layers varying from one-thirtieth to one-tenth of an inch in thickness; but the lamination was often concealed; and it was only where the loam had been freshly broken away that the layers were sufficiently distinct to be counted. Shells were embedded in the loam, but mostly in the lower half of the bank; those of the genus "Paludina" were the most abundant, whilst bivalves of the genus "Corbicula" occurred, but not in any numbers. The upper three feet of the river-bank were riddled with the burrows of annelids, and these burrows were often filled with little rounded masses of loam, evidently the excrementitious droppings of the worms.

If, as in the case of the alluvial valley of the Nile, it be considered that each of the fine layers which compose the bank of the Yang-tse was deposited during the periodic annual inundation of the river, then every layer will represent a year's deposit; and taking the average thickness of each layer to be one-twentieth of an inch, it would require twenty years to form an inch and a century to form five inches; whilst the whole thickness as exposed in the river-bank would require for its formation a period of between 7000 and 8000 years.[1]

[1] The borings and excavations round the pedestal of the statue of Rameses at Memphis enabled Mr. Horner to estimate the rate of deposition of the alluvium of the Nile at 3½ inches in a century. (*Vide* Lyell's "Principles of Geology.")

It may be pertinent to the subject of this paper to remark on the general appearance of the region around Hankow. A vast alluvial plain extends to the horizon in all directions; whilst dotted over its surface are several shallow lakes, which are lost in the general flood of waters when the Yang-tse overflows its banks in the summer months. Rising abruptly out of this alluvial formation are a few isolated groups of low hills, which in the time of flood stand out like islands from the surrounding waste of waters.

It would be interesting to asertain whether the banks of the Yang-tse possess this lamination whenever the river winds its way through an alluvial plain. I noticed the same appearance in the low banks of the estuary near the village of Wusung; the horizontal layers varying in this instance from one-tenth to one-fourteenth of an inch in thickness. Shells of both fresh-water and salt-water genera—"Paludina" and "Mactra"—were embedded in the bank.

An Experiment on Inherited Memory

WHEN I was a boy I had an electrical machine and Leyden jar; there was also a dog in the family. As a matter of course I "electrified" the dog, and ever afterwards during the remainder of his natural life he ran away in extreme terror when a bottle was presented to him.

The recollection of this has recently suggested an experiment that may be made by some of the readers of NATURE. By means of a small Leyden jar moderately charged startle *both the father and the mother* of an intended forthcoming generation of puppies. When these are full grown and away from their parents observe whether they are at all disturbed by the sight of a bottle or a Leyden jar, care being taken that the bottle is never shown to the parents in the presence of the offspring.

A single experiment will not be sufficient. It should be tried by several; for which reason I suggest it here. There is no more cruelty involved than in an ordinary practical joke. It is not the pain of the shock, but its startling mystery that frightens the animal, especially if the shock is given by placing the jar on a piece of tinfoil or sheet metal, and allowing the dog spontaneously to investigate by smelling the knob of the jar while his fore-feet are in communication with the outer coating. Under ordinary circumstances the dog obtains through his nose much information concerning the properties of things before he actually touches them, but in this case his whole life experience is contradicted by the mysterious, inodorous, diabolical vitality of the vitreous fiend. A bottle thenceforth makes upon the intellect of the dog a similar impression to that which a sheeted broomstick in a churchyard makes upon the similar intellect of a superstitious rustic.

W. MATTIEU WILLIAMS

Stonebridge Park, Willesden

Meteors

THREE very bright meteors were observed here during the month of December, 1880, and are, I think, worthy of record.

1. December 2, 1h. 14m. 50s. a.m. A meteor brighter than Jupiter descended towards the west point of the horizon, passing about 1° N. of Saturn, and somewhat farther from Jupiter, and in a line therefore nearly parallel to that joining those two planets. The train was visible about three seconds.

2. December 8, 10h. 55m. 30s. p.m. A meteor as bright as Jupiter descended towards the north point of the horizon, about 1° below η Ursæ Majoris, its path being inclined at an angle of about 35° to the horizon. The train was brilliant, but vanished speedily.

3. December 24, 10h. 4m. p.m. A very bright meteor, seen through (or below) the clouds in the south-south-east, shot down towards the south-south-west point of the horizon, at an angle of about 30°. No stars were visible in that part of the heavens at the time.

Upper Clapton, March 17

Classification of the Indo-Chinese and Oceanic Races

IN your issue of December 20 (p. 199), just to hand (February 12), I notice a contribution by Mr. A. H. Keane on the classification of the Indo-Chinese and Oceanic races.

As the *Orang Semang* of the Malay Peninsula is only just referred to, I conclude that the author has not seen Maclay's papers on the wild tribes of the Malayan Penin
second number of the *Journal* of the Straits Branch
Asiatic Society and a memoir by the same writer in
of Eastern Asia, of which unfortunately only
appeared. On the Jakuns, Maclay, who has probab
of their inner life and habits than any other ethnol
as follows of the *Semang* and *Lakai* tribes:—"Logan
of the Indian Archipelago, vol. vii. p. 31, 32), "tho
from some others, says that the *Orang Semang*
Negritos, but he calls them a mixed race. Accor
experience I must declare this also to be incorrect.

"From my own experience and observations I have
conclusion that the *Orang Lakai* and the *Orang*
tribes of the same stock, that further, in their phy
and in respect of language they are closely connecte
other, and represent a pure unmixed branch of the
race; anthropologically therefore they absolutely dif
Malays. The Melanesian tribes of the Malay Penin
because of the form of their skull, which has a ten
brachycephalic, approach the *Negritos* of the Philip
like the latter, they do not differ very widely from
tribes of New Guinea."

In the fifth number of the *Journal* of the Straits
the R.A.S., Mr. Swettenham, the Assistant Colonial
for the Native States S.S., thus describes the
Ijoh:—

"These people are short in stature, dark in colour,
hair is close and woolly like that of negroes, with
ence, that all the men wear four or five short tufts or c
of hair growing on the back of their heads, called

During my botanical excursion through Perak
had two *Semangs* as guides, answering to Mr. Swe
description.

The Straits Branch of the R.A.S. is as yet in
having been established only in 1877, and its Journa
bably not yet secured a very wide circulation, although
numbers that have been published contain practi
authentic information about the Malayan Peninsula
found elsewhere.

The characters Mr. Keane has employed to indicate
"papûwah" are certainly not Malayan; at any rate
a matter of impossibility to secure the services of a
Singapore who would be capable of deciphering the
word, which is a corruption of the Malayan or Javan

tive *puwah-puwah*, is usually spelt thus— 
Writing about New Guinea, Crawfurd ("A Descrip
tionary of the Indian Islands," p. 300) thus expres
about the word Papua:—"Some recent geograph
thought proper to give the great island the name of Pa
an innovation which is correct neither in sound, sense
graphy seems to possess no advantage over one whi
borne now for nearly three centuries and a half."

It may not be out of place here to remark that
Trübner and Co. are the London agents of the Straits
Singapore S.S., February 12

Fascination

IN the interior of the province Valdivia, South Chili
of wood-snipe (*Paipayen inc.*) is often caught by the
the following manner:—When the bird flies into one of
bushes, which in spots of about three to six metres diame
found frequently in the wood-meadows there, two men on
back go round it in the same direction, swinging their
the bush. After ten or more rounds one man slips down
his horse, whilst the other continues, leading his compa
horse behind. Carefully then the first man creeps on to the
where the paipayen is sitting nearly motionless or stupefied
the rider's circular movements, and kills it by a quick blow
stick.

When I first was told so I would not believe it; but in
or 1854 I took part myself in this kind of capture in the
San Juan, in Valdivia, belonging to my chief, Dr. Ph
now professor in the University and director of the
Santiago. I had left the house without gun, accompanied
native servant, when, in a part of the wood called
observed a paipayen falling into a dense but low bush

-mentioned kind. Desiring to obtain a good specimen of ot very common bird for our collection, I expressed my at not having the gun, but the servant replied: "Never if you wish, we will get the bird." And he caught it ny assistance in the above way without injuring it.
rburg, March 16 CARL OCHSENIUS

Flying-Fish

NE 11, 1873, at sea 300 miles south of Panama, I saw a of-war hawk and a school of bonitos in pursuit of a school ing-fish. As one of the latter came out of the water, y pursued by his enemy, the hawk swooped down, not fifty from the ship, but missed his prey, the fish *apparently* ag from its course to avoid him. A second attempt was successful, and the hawk flew off with the flying-fish in his s. The whole affair was plainly seen, as also was the nued chase of the flying-fish by the bonitos.

ALLAN D. BROUN,

THE OXFORD COMMISSIONERS ON PROFESSORS

E are not disposed to agree with the outcry which has been raised in some quarters in reference he proposition of the Oxford University Commis-ers to enact certain regulations with the view of pelling Oxford Professors to reside in the University to give lectures.

me of the Commissioners' regulations relating to subject appear to many to be ill-advised, but they e been improved by the recent modifications, and the eral intention seems not only a right one, but also which must be carried out whenever public opinion ought to bear on the matter.

very simple view of the matter may be suggested. The essors in the English Universities might be put on same footing as are the professors in German Uni-ities. In those Universities the professors carry on adant research; they also give very numerous lec-s, usually what may be called "representative ses," that is, courses in which an attempt is made resent to the student the main outlines and much he detail of the subject professed. Even in the ège de France at Paris, which is *not* (strictly speaking) educational institution, each professor is required to an annual course of lectures (to the number of forty, believe).

esearch and the advancement of learning are, we do for a moment doubt, the highest, and therefore in a ain sense the first business of University professors. s perhaps because this is so generally admitted that Commissioners did not at first insist upon it. But it is rder that he may teach—not huge popular audiences cram-classes, but devoted thoroughgoing students— the professor creates new knowledge. His best ult is not new knowledge itself, but new youthful inves-tors ready and able to carry on the researches which as commenced, and through which they have learnt hod and gained enthusiasm. There is no stimulus to earch so healthy and so sure as that afforded by the ortunity of converting a class of generous-minded ng men into ardent disciples and loving fellow-workers. lence, it may be maintained, there is no neces-y antagonism between *true professorial teaching* (*i.e.* nite courses of lectures) and the profoundest study research.

hat the Commissioners have introduced no binding ulations with the object of forcing a professor to carry research, is, we believe, a proof of wisdom and a tribute to the dignity of such work. No regulations make an investigator: the question as to whether a n professorship will be used for the advancement of science and learning is decided before any regulations can have effect, viz., when the choice of a person to fill the post is made. If he is a "searcher" already, he will remain so; if he is not, a bad choice will have been made, and no regulations as to research can ever amend it. It is, however, well that the Commissioners have seen fit to improve their first set of regulations in so far as to state that an Oxford professor is *expected* to advance the study of the subject to which his chair is assigned.

The measures which the Commissioners propose for insuring the delivery of lectures by Oxford professors are objectionable on the ground that they are purely penal. They should be persuasive. The German professor is only too glad to give a thorough and attractive course of lectures if he has it in him to do so, because he thereby doubles or trebles the income which he derives from endowment. The Oxford Commissioners have made a great mistake in prohibiting the professors from charging fees for the compulsory course of two or three lectures a week. All students, whether belonging to the professor's own college or not, should be liable to pay fees to the professors for attendance on their courses of instruction, whether lectures or laboratorial. It is only by so arranging the position and endowment of a professor that he is both able and willing to increase his income by the fees paid by his class, that a really firm and satisfactory basis for the regulation of a professor's duties can be obtained.

It has been maintained that where an income derived from an endowment of 600*l.* can be increased to 1000*l.* a year by the receipts from lecture-fees, the professor will be anxious to give such lectures as will attract students—and in spite of objections ready to hand, it is held that those are the lectures which should be given. It is not true that a professor so circumstanced will necessarily degenerate into a mere examination coach. If he should be tempted to do so the fault lies with the examination. The professor should himself have a voice in the arrangement of the examination, and care should be taken by the University that it is so organised and defined in all its parts that students who have carefully followed a high class of professorial teaching, such as would be offered by a Huxley, a Ludwig, a Bunsen, or a Fischer, should come to the front in it rather than those who have crammed with some newly-fledged classman, or with an experienced "coach" versed in all the artifices of sham knowledge.

It appears to be an excellent and necessary provision to which it is to be hoped that the Commissioners will adhere in spite of all opposition, that the professors in each faculty should with other University teachers in the same faculty constitute a council having the power of controlling to some extent the lectures of each individual professor. There is no degradation in this; it is the almost universal custom in existing Universities. The faculty has to provide for the teaching of its proper studies, and naturally must exercise a friendly control over the extent and scope of the courses of instruction offered by its members.

It is owing to the absence of any such control at the present moment that even by those Oxford professors who do lecture, no representative course on *any subject* is ever given. A student in Oxford cannot by any possibility attend a thorough *course* of lectures or laboratory instruction in physiology, nor in zoology, nor in botany, nor in physics, nor in chemistry. And yet in the smallest as well as the largest of the often despised "medical schools" of London, a student has provided for him courses of from thirty to a hundred lectures every year in all these subjects, as well as in others, to be attended, of course, in successive sessions. The same absence of complete or representative courses of instruction is to be noted at Oxford in other departments, such as philology, archæology, various departments of history, &c.

The sole cause of the existence of such complete courses in other institutions than Oxford—over and above the primary one connected with the income from fees—is that the professor has to submit his scheme of lectures for the ensuing session or year in a general way to his colleagues, who would suggest to him a more complete or more representative program, were his proposals considered insufficient, and might take steps to supplement his teaching by the appointment of a supplementary professor (thus diminishing the original professor's income from fees), were he to prove intractable.

The keystone of the professorial system, on which all such control and persuasion, co-operation and reciprocal criticism, must rest, is the income from class-fees. In having not only not insisted upon this, but in having actually prohibited the free levying of fees, the Oxford Commissioners have made their scheme for professors absolutely unworkable. They have simply played into the hands of those who have at present a most injurious monopoly of the fees paid by students, and who give in return as little and as inadequate teaching as they please, namely, the confederacy of boarding-house keepers known as "college tutors and lecturers."

The proposal that professors should examine their classes and report to the Heads of Colleges as to the performance of each student was characterised by a spirit of petty interference quite unworthy of the large objects placed before the Commissioners, and has very properly been withdrawn. Such details, together with some other points, might well have been left by the Commissioners to the Councils of Faculties, which they so wisely intend to bring into existence.

It may be urged that if the Commissioners were to confine themselves in these and similar matters to creating the organisation which is terribly needed at Oxford, and of which these Councils of Faculties promise to be the most powerful and important part, they might with very great advantage leave the question of terminal examinations, and the scale of fees to be charged for lectures, &c., to be worked out by the reorganised University itself. But instead of prohibiting class-fees they should have strengthened the hands of the professoriate in the competition with the powerful band who are interested in maintaining the disastrous and absurd system of college tuition and tuition-fees. So long as the undergraduate is forced to pay to college tutors a lump sum of 25*l.* a year, he will seek his instruction (whether he finds it or not) from those whom he has been compelled to pay, and not from the professors whom he is not allowed to pay.

It is clear that with the present body of free-holders it was necessary for the Commissioners to insist on the new principle that a professor is not to be free from responsibility (*Lehrfreiheit*, we may observe, does *not* mean "freedom *from* teaching," as some writers who in the daily papers have recently appealed to German precedents almost seem to fancy), but is, on the contrary, to be charged with certain duties and to be responsible in a measure to his brother professors for performing those duties in a satisfactory manner.

ACADEMICUS

THE INTERNATIONAL GEOLOGICAL CONGRESS

THIS Congress is to hold its second session at Bologna, commencing on September 29, 1881, under the presidency of Signor Q. Sella, president of the Accademia dei Lincei of Rome, and under the patronage of His Majesty the King of Italy, who has liberally placed the necessary funds at the disposal of the Italian Committee of Organisation, of which Prof. J. Capellini of the Bologna Museum is the president, and General Trannelli of the University of Pavia the secretary.

The movement sprang out of a suggestion made at a meeting of the American Association of Scien Buffalo, New York, August 25, 1876, that a tional Geological Congress was advisable, uniformity of methods of representing geolog mena, and the value of terms. Towards this mittee of organisation was formed, of wh James Hall was president and Dr. Sterry H tary, in which England was represented by Pr and Sweden by Dr. Otto Torell. The res deliberations was the first session of the Co at Paris, in the Palace of the Trocadéro, unde dency of Prof. Hébert and the patronage of t of Public Instruction. At the Congress, whic days, two International Commissions were ap one to consider geological cartography, with adopting a common system of signs and c other to investigate the possibility of effecting cation of geological nomenclature and to c matters relating to stratigraphical classifi nomenclature, to a certain extent involving into the value and significance of petro palæontological characters. A third Commissi French, was also appointed to report on Bolo rules to be followed in establishing the nome species in mineralogy and palæontology.

M. Renevier, general secretary of the first C has just published his second report of pr states that advantage was taken of the presenc members of the Commission during the fi versary meeting of the Geological Society of April 2, 1880, to hold a meeting of the Com which five European countries were represe the presidency of M. Daubrée; since then, m detailed reports from nearly all the committee ing different countries have been received, e Canada, presided over by Mr. Selwyn, and G by Prof. Ramsay. In some of these schemes considerable amount of agreement. Quaterna being represented by a pale green, Plioce yellow, Miocene dark yellow or orange, Eocen Cretaceous by green, Jurassic by blue, Lias Trias by burnt sienna, Permian and Carbo dark grey, Devonian by brown, or brown stripe Crystalline schists by rose carmine, Granit carmine, divisions in the various rocks being by tints of the same colour, or by shading or d

The General Secretary of the Commission f fication of Nomenclature is M. Devalque, w that this Commission also met at the Paris Society's anniversary, France being represen Hébert, Switzerland by Prof. A. Favre, and Ge by Prof. Hughes. The latter Commissioner Prof. Prestwich, has now succeeded in or British sub-Commission, who have appointed mittees to inquire into groups of formations, draw up a list of the names now in use; (2) t the true significance of such names or terms, gi ence to the authors by whom they were used i instance, or subsequently with a modified mea to investigate into the synonomy of such names in the first place as regards the British Isles, wards to inquire into their correlation with them other areas; and (4) to offer suggestions for th tion of the nomenclature. As the committees c sit, as their members are scattered, they h modelled on the principle of the Inquiry Com the British Association, and have attached to or two "reporters," charged with assimilating and facts collected by the Committee. The rep the British Isles, are for Recent and Tertiary rock Starkie Gardner and H. B. Woodward; for C rocks Messrs. Topley and Jukes-Browne; for rocks Messrs. Huddlestone and Blake; for T Permian, Mr. De Rance and the Rev. A. Ir

an, and Old Red, Messrs. Morton
ian, Cambrian, and Pre-Cambrian,

NIAGARA IN WINTER

last February it fell to my lot to
y the transcontinental journey of
Francisco to New York. Before
the one stoppage which I could
ould be made at Niagara. I had
early summer of 1879, and was so
y them that I could not resist the
them again under their wintry
nfirmed in my resolve by seeing
merican papers to the effect that,
nued and exceptionally severe cold
ie Ice-mountains at the Falls were
higher than had ever been previously known. These statements were confirmed to me on the spot by several persons long resident in the village.

Two or three preliminary notes on the journey across the Rocky Mountains in midwinter may not be without interest for the readers of NATURE. I left San Francisco on February 2nd in the midst of most serious floods, and on that particular day they attained their maximum, which was one inch higher than any previously recorded. It was estimated that 3500 square miles of the most fertile land of California was under water, and in many parts steamboats of light draught were plying over the country. Any assessment of damage would have to be made by millions of dollars. I heard many and grievous complaints of the damage done to the agricultural interests of the country by the "hydraulic mining," which washed the hillsides down into the river beds, filling them up, and thus prevented much flood-water from being carried off. In some places the railroad track had been apparently washed away, for it could not be found, and from this cause our journey to Sacramento was lengthened about fifty miles, as the gigantic ferry-boat *Solano* could not be used for the short route. This boat has four tracks upon it, and will carry twenty-four cars. As each car seats fifty people, this is equal to carrying a train that will accommodate 1200 people. It has four side-wheels, each with its engine and set of boilers. In crossing the Sierras we encountered little snow, but a great deal of rain. The greatest amount of snow on the journey was in the upper part of the Weber Cañon, 100 miles east of Ogden and Salt Lake. Here there had been considerable difficulty in keeping the line open during January, but the train-service had not been interrupted for a single day, although the snow-sheds and snow-ploughs were constantly required. That the weather had been unusually severe was shown by the very large number of dead cattle along the line, from Ogden across the Laramie plains, and also, I was informed, in Colorado. In the four days between San Francisco and Omaha (where we arrived punctually), the terminus of the Pacific Railroad, the temperature was never below 26° F., and the air so still that I frequently saw smoke rings from the locomotive funnel expand to 6 or even 8 feet diameter, rising perhaps 30 or 40 feet in doing so. All the cars were warmed, usually to too great an extent, from 70° to 75° F., being the normal temperature for the interior of railway cars, hotels, private houses, and schools, as far as my experience went.

East of the Missouri (which, like all the rivers I crossed, was frozen over) trains were everywhere very much delayed, owing to snowstorms, or to the slippery state of the rails, which were coated with ice. The utmost caution was used by those in charge of trains, and a strong impression was left on my mind that safety, and not speed or punctuality, was the primary consideration in such American railway management as I came across.

On leaving Chicago a phenomenon presented itself which is common enough in America, though but rarely seen in this country, and never on so gigantic a scale. For several days the temperature had been very low, and every object was exceedingly cold. On the night of February 6th, the air-temperature rose to 33° F., and fine rain fell. This froze upon everything and encased it with transparent ice, from which in many instances delicate icicles depended. Sad havoc was played with the overhead telegraph wires in Chicago itself (which were broken by the weight); but on leaving the city in the early morning the exceeding beauty of the whole country, usually so uninteresting from its flatness, became apparent. A light coating of snow lay on the ground, but everything, every twig, every dead leaf, every blade of grass, had its own transparent covering, which in the occasional gleams of the sun shone with the most gorgeous colours.

Gigantic icicle under Table Rock, photographed in January, 1893. The upper right-hand corner is rock, and a portion of the Canadian (or Horse-Sh is seen on the left. The whole of the apparent ground is a mass of frozen spray which has accumulated many feet in thickness on the slough a the foot of the rock.

Probably the most wonderful exhibition ever seen, of, not frozen rain, but frozen spray, was to be found at the Falls of Niagara. A large number of readers of NATU have visited them, and possibly all are sufficiently fam

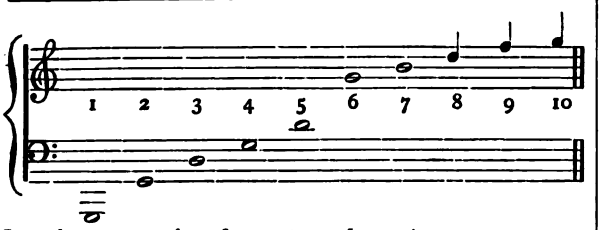
The accompanying woodcut, photographed on to the wood block from a photographic picture taken a few days prior to my visit, will, to those who know the place, give some faint idea of the beauty of the scene, and of the gigantic scale of the icicles. It is scarcely necessary to say, perhaps, that the circular wooden staircase by which the descent under Table Rock is effected, was covered with many feet thickness of ice on the side next the Fall. As the air-temperature was slightly above 32° F. and the icicles were occasionally falling around us, my guide was unwilling that I should remain long, or make any attempt to measure any of the ice-masses.

The fourth, and to the casual visitor perhaps the most remarkable effect of the cold in the immediate neighbourhood of the Falls, is the manner in which every surrounding object is coated with an immense thickness of frozen spray. The trees on Goat Island and in Prospect Park are thus covered to a slight extent, and present a very beautiful appearance. The strangest examples, however, occur on the Canadian side, close to the Horseshoe Fall, where huge irregularly-shaped masses of ice are seen, some of which resemble, in general form, merely a colossal bunch of grapes standing erect on its stalk. A little investigation shows that these are trees, staggering under the weight of tons of ice. Not unnaturally they have many broken branches, and have almost invariably lost their tips. In one instance which I saw, and of which I obtained a photograph, the spray had so accumulated in front of the trunk of a tree about nine inches in diameter, that it had formed a wall of ice *five feet* in width, and of the same thickness as the diameter of the tree-trunk. A flagstaff planted on Table Rock had four or five projections from its top, varying from three to five feet long, and looking like "frozen streamers," or as though watery flags had been flying, and had suddenly been frozen. These were so inaccessible and so dangerous to the passer-by, that they were daily shot down with rifle-bullets! The museum with its pagoda and the adjoining houses close to the Horseshoe Fall were cased with sheet-ice and pendant icicles to such an extent that much of the frozen spray had to be removed daily with an axe.

I mounted to the pagoda (well remembered, I have no doubt, by summer tourists) and there I listened to the "Music of Niagara," of which Mr. Eugene Schuyler has given in the February number of *Scribner's Magazine* an account so interesting, that I venture to conclude this article with a short abstract of it.

Mr. Schuyler starts with the statement that "the tone of Niagara was like that of the full tone of a great organ. So literally is this true that I cannot make my meanings clear without a brief outline of the construction of that great instrument." He then explains the mutual relation of the various pipes, the "ground-tone, over-tones or harmonics, and under-tones or sub-harmonics," and relates his experiences in the Cave of the Winds, on Luna Island above the Central Fall, at the Horseshoe Fall among the rapids, and at the Three Sister Islands. "In fact, wherever I was, I *could not* hear anything else! There was no *roar* at all, but the same great diapason—the noblest and completest one on earth!" Further details of visits to various points are given, and it is interesting to notice that although previously unacquainted with the difference in height of the two Falls, Mr. Schuyler unhesitatingly pronounced the Horseshoe Fall to be several feet lower than the other, guided solely by his musical ear. He then proceeds thus:—

"Now, what is this wonderful tone of Niagara? or rather, what are all these complex tones which make up the music of Niagara? With more or less variation of pitch at various points (to be accounted for), here are the notes which I heard everywhere:—



Just these tones, but *four octaves lower!*

"At once it will be incredulously replied, 'No human ear ever has heard, or ever can hear, tones at such a depth.' I arrived at my conclusions both theoretically and practically, and the two results coincided exactly." For the explanation of this, those interested will do well to consult the article itself. It may be noted here, however, that notes 3 and 4 were heard *everywhere;* that the 5th and 6th were perfectly distinct, but of far less power; that the 7th (the interval of the tenth) was of a power and clearness entirely out of proportion to the harmonics as usually heard in the organ, &c.; and that the 8th, 9th, and 10th notes were only heard occasionally and with a transient impression. Mr. Schuyler then points out that, allowing for the fact that the diameter of Niagara is the *greatest* possible compared with its height, the length of an organ-pipe necessary to give the key-note of Niagara (four octaves below note 1 in the diagram) would be just the average height of the Falls! The figures given are 170·66 feet – 10·24 feet = 160·42 feet, where the 10·24 feet is the allowance for the extra diameter of Niagara treated as an organ-pipe.

It appears, then, that the tone of Niagara is, *note for note*, the dominant chord of our natural scale in music. Its rhythm is one note per second, with three notes in each measure, the first note being the accented one, and the single beats are represented by groups of three semi-quavers, where M.M. 60 = ♩ or three times three, three times repeated.

Mr. Schuyler thus concludes in words with which I heartily sympathise. "I have spoken only of the pitch and rhythm of Niagara. What is the *quality* of its tone? Divine! There is no other word for a tone made and fashioned by the Infinite God. I repeat, there is no *roar* at all—it is the sublimest music on earth!"

WILLIAM LANT CARPENTER

ZOOLOGICAL RESULTS OF THE VISIT OF PROF. K. MOEBIUS TO MAURITIUS[1]

THIS work, which is illustrated by a map and twenty-two plates, contains the results of the investigations of Prof. Möbius on the marine fauna of Mauritius and the Seychelle Islands, embodying the account of observations made by him on the spot, and of work done on the collections which he brought home with him on his return from his visit to the islands. It commences with an account of the journey to Mauritius in 1874-75; an account of the Suez Canal is given, and of the voyage through the Red Sea, where Trichodesinium, the yellowish-red floating algæ supposed by some to have given the name to the sea, was met with in abundance. After the well-known tanks of Aden and the Somali divers who surround every ship that comes into the port have been described, Réunion is touched at, and at last Mauritius.

A concise account is given of the geographical, geological, and climatic peculiarities of this island, which is about one-third the size of Holstein. The centre of the island is occupied by a plateau elevated over 1700 feet above sea-level, the highest point being 2711 feet in height. The plateau is surrounded on nearly all sides by mountains, and from these on all sides but the northern, where there is a gradual inclination, rivers and streams fall down very steep slopes with frequent waterfalls into the sea. Rains are very heavy, and the mountain torrents swell with remarkable rapidity. The geological structure of the island is entirely volcanic, with the exception of beds of coral rock. The mean temperature of the year is about 25°85 C. Rain is most abundant from December to May. The prevailing wind is the south-east trade. Cyclones are sometimes experienced in the period, December to April, but do not occur every year.

Mauritius had originally no mammalian inhabitants excepting bats. The great fruit-bat (*Pteropus vulgaris*) is abundant in the woods. These fruit-bats are easily tamed. One of them was a great pet of Mr. G. Clark, now dead, who was the author of "A Brief Notice of the Fauna of the Mauritius," published in the *Mauritius Almanac* for 1859, and containing some very good observations. This tame bat was taken when young from its mother's breast and brought up by hand. It could not fly, because its wing membranes had been cut through to prevent its doing so. It usually passed its time hanging on to the back of a chair. Directly Mr. Clark came into the room it cried out loudly to be nursed. If it were not taken up at once it climbed up to him, rubbed its head against him, and licked his hands. If Mr. Clark sat down the bat hung on at once to the back of the chair, and followed all the movements of its master with its bright eyes. If its master caught hold of a fruit it climbed forth with down his arm to his hand to get its share, and it always got two teaspoonsful out of every cup of tea or coffee. If Mr. Clark took any kind of object in his hand the bat climbed to it, examined it with its eyes and nose, and only returned to its chair-back after completely satisfying its curiosity. It followed its master even into the open air if the door was not shut to prevent its getting out.

A good many mammals have been introduced into the island, and are now abundant. A monkey from the East Indies (*Macacus cynomolgus*) inhabits the woods, and makes excursions from thence to plunder the sugar-cane fields. One of the species of the curious hedgehog-like insectivora of Madagascar (*Centetes ecaudatus*) was introduced in the island at the end of the last century. The animals live in damp places and lie in a state of sleep (= hybernation) in the dry season, sleeping therein so soundly that they do not awake even when dug up. As soon as the rainy season begins in November they wake up and breed, producing three litters of fifteen or sixteen young every year. The young follow the mother, who calls them with a grunting noise, in a row behind, and protects them when molested with her teeth and spines. A full-grown male weighs as much as four pounds. The animals are so abundant that on a moonlight night with trained dogs twenty or thirty may be caught by one hunter. They are eaten by the working classes.

Besides these there is a shrew mouse, also introduced from the East Indies, a small hare, and the ubiquitous common rat, both of which latter gnaw and destroy the sugar-cane. A stag (*Cervus hippelaphas*) introduced by the Portuguese inhabits the woods. It breeds in July and August, and casts its horns in December or January.

We cannot follow the author in his short reference to the birds and account of the fish. The coral-reefs of the island appear to abound with animal life of all kinds. Several of the corals composing them are laid dry constantly at low tide, and remain exposed to the air without injury. *Goniastræa retiformis* and *Leptoria gracilis* are cited as examples of such. Whilst these corals are in this condition, the polyps remain entirely withdrawn, and the whole surface of the coral laid bare is covered with slime, which prevents its drying up.

In the Seychelles, of which a short account is given, the giant turtle (*Chelone virgata*) is kept in ponds as at Ascension, and is caught with a rope round the flipper and dragged out to be slaughtered when convenient. The

[1] Beiträge zur Meeresfauna der Insel Mauritius und der Seychellen, bearbeitet von K. Möbius, F. Richter und E. von Martens, u.s.w. (Berlin: Otto Enslin. 1880.)

or here dug up a Cæcilian (*Cæcilia virgata*), and ied himself with the curious leaf insect (*Phyllium folium*).

ıe Introduction to the book is followed by a long r by Prof. Möbius on the Foraminifera of the ritius, illustrated by many finely-executed plates. ıngst other Rhizopods a Haliphysema occurs, the ıal which, by a most extraordinary blunder, was made by Häckel to have a multicellular structure, and ıosed to represent a Gastræa of modern times. Prof. ıius confirms the observations of Carter, Savile Kent, Ray Lankester, to the effect that the animal is in ty simply a Rhizopod. He has examined the struc- of the Foraminiferous shells which he describes, very fully by means of sections. He does not, however, anything of importance to our knowledge of the cture of the soft tissues of the group.

n account of the Decapod Crustacea by Dr. F. ıter follows that of the Foraminifera. Two crabs of t extraordinary habits are described in this portion he work. Both belong to the family Polydectinæ. : crabs of this family have their front claws armed ı large teeth. Latreille, who first named the crab *ydectes cupulifer*, remarked that a gummy substance always to be found at the ends of the claws of this cies, and Dana described the animal as having always ıething spongy in its hands. Dr. Möbius has discovered remarkable fact that these things held in the two ws of the crab are in reality living sea-anemonies. ese sea-anemonies are attached to the immovable joint each claw, whilst the teeth of the movable joint of claw are kept buried deep into the flesh of the sea- monies, and thus hold them fast, although each mony can easily be pulled away from its position with forceps in specimens preserved in spirits. The mouth he sea-anemony is always turned away from the crab. e same curious combination exists in the case of ther species of the same family but of a different ius, *Melia tessellata*, which also inhabits Mauritius. igure is given of this crab with its pair of Actinias, ned by Möbius *A. prehensa*, with fully expanded tacles, held out one in each hand. Möbius gives the lowing account of the matter. "I collected about fifty le and female specimens of *Melia tessellata;* all of se held in each claw an *Actinia prehensa*. The re- ved hooks of the inner margins of the claw joints of crab are particularly well adapted to hold the Actinias t. I never succeeded in dragging the living Actinias t without injuring them. If I left the fragments of em when pulled out lying in the vessel in which the *elia* was, the crab collected them again into its clutch a short time. If I cut the Actinias in pieces with the ssors, I found them all again in the claws of the crab er a few hours. It is very probable that the Actinias l the crab in catching its prey by means of their thread- lls, and that the Actinias, on the other hand, gain by ing carried from place to place by the crab, and thus ought into contact with more animals which can serve food to them, than they would if stationary. This is very interesting case of commensalism."

The work closes with a long account of the Mollusca Mauritius and the Seychelles by Prof. E. von Martens.

H. N. MOSELEY

NOTES

THE centenary of the birth of George Stephenson is not to be lowed to pass by in a fruitless way in Newcastle-upon-Tyne. inners, speeches, trade-processions, enthusiasm and bunting—l this was to be expected in a place so intimately connected th the birth of railways. But more than this will probably be ne, and we are glad to hear that a scheme is on foot for com- emorating the 9th of June in a more useful and more lasting nner, viz. by providing a "Stephenson College" for the use of the houseless but hard-working College of Physical Science of the University of Durham in Newcastle.

THE French Association for the Advancement of Science has been in existence only ten years, but in that short time it has met with astonishing success, and has done some excellent work. To the fifteen sections already existing it proposes to add a sixteenth, under the name of the Section of Pedagogy, and a committee of members will discuss its formation at the forthcoming meeting at Algiers. The subjects of which the Association takes cognisance are divided into four groups, viz., Mathematical Sciences, Physical and Chemical Sciences, Natural Sciences, and Economic Sciences. A goodly list of papers has been already announced, among the authors of which we notice some of the most prominent *savans* in France. We trust, however, that the Association will not degenerate into a great excursion organisation, as to some extent it appears to have done this year. Thus the meeting lasts for six days, while the return tickets, issued in connection with the Association under very liberal terms, are good for six weeks, and no less than fifteen excursions in the neighbourhood of Algiers have been arranged. Five of these each occupy a week, and one of them a fortnight. The great number of applications for tickets both from France and Spain compel us to imagine that in many cases the membership of the Society has been sought this year rather for the sake of the tempting excursions than for the love of science. April is one of the most lovely months in the year at Algiers: the mean temperature is 16·5° C., with a possible minimum of 8°, and a possible maximum of 30°. In May the mean temperature is 19·5° C., and there may be eight days of rain; while at Biskra the maximum may be as high as 40° C. (104° F.), and not more than one day of rain may be expected in May. A proclamation has been issued by the local committee asking the inhabitants to place rooms at the disposal of the visitors. Among those who will cross the Mediterranean will be Admiral Mouchez, MM. Quatrefages, Wurtz, Saporta, the naturalist, M. Cartaillac, the geologist, and many others, who will give interesting papers on a variety of subjects.

MR. ASHTON DILKE tried in vain on Tuesday to get the House of Commons seriously to consider the advisability of adopting the decimal system of coinage in this country. It is hopeless in the present state of public affairs to induce Parliament to attend to a matter of this kind. On the widely beneficial results of the adoption of the metric system in whole or in part we have often insisted. That there would be some inconvenience in making the transition, of course every one will admit; but as compared to the ultimate benefits from the adoption of the metric system, they are not worthy of consideration. Mr. Dilke does well not to let the matter drop out entirely of public notice.

THE Thore prize of the Académie des Sciences of Paris has been awarded to M. A. Vayssière, préparateur des cours de Zoologie à la Faculté des Sciences de Marseille, for an anatomical memoir of *Prosopistoma punctifrons*, Lat. Some of our readers interested in comparative anatomy may remember having seen the original drawings in London last summer, and will be glad to know that it will soon be forthcoming. M. Vayssière is a careful expert.

THE French Minister of Public Instruction intends to do a great service to science by publishing monthly a *résumé* of the scientific work being done over France, under the title of *Revue des Sciences*. The review will be under the direction of the venerable M. H. Milne-Edwards, and will consist exclusively of analyses and summaries, but of sufficient detail to give a fair idea of the nature of the work being done. It will embrace the work of individuals and of societies all over the country, and each number will contain about 100 pages.

M. Delesse, a member of the Institute, vice-president of the Geographical Society of Paris, and author of a number of works and papers on geology, died in Paris at the age of sixty-three years.

The death is announced on the 25th inst. of Sir Charles Reed, M.P., the much-respected chairman of the London School Board.

A meteorological observatory has been erected at Port-au-Prince, Haiti, under the care of the Rev. Father Wiek, on ground granted by the State. It is an octagon of two stories and a platform. Besides the indispensable instruments it has electric clocks (for communicating the time to clocks outside), telephones, microphones, phonographs, radiometers, &c.

The inaugural meeting of a Society of Chemical Industry will be held in the rooms of the Chemical Society, Burlington House, Piccadilly, on April 4, at 4 p.m. This Society is not intended to represent any one particular branch of chemical industry. It is hoped that it will be representative of many manufactures—alkali-making, manure-making, the textile colour industries, the glass and pottery manufactures, tar distilling, soap-making, sugar-making, brewing, metallurgy, the manufacture of fine chemicals, and all other industries which show any connection with chemical science.

The newly-issued part of the *Medical Reports* which are from time to time issued by order of the Inspector-General of Chinese Maritime Customs, contains an elaborate monograph by Dr. Duane B. Simmons on the subject of Beriberi, or the Kakké of Japan, which includes some interesting notes on the history and geographical distribution of the disease, and is illustrated by a sketch-map.

Mr. Bowdler Sharpe, F.L.S., delivered on Thursday last the concluding lecture of a series on the "Birds of the World," which he has been giving at Tonbridge School. Throughout the winter lectures have been given on various literary and scientific subjects by Prof. Henry Morley, Rev. A. Lucas, and others, and large and attentive audiences have shown great interest in all the series. The school already possesses a small museum, which is increasing under the auspices of the present head-master, the Rev. T. B. Rowe, who is evidently doing his best to encourage a taste for science and literature in the institution under his charge.

Every ornithologist should read a little pamphlet recently sent to us by the Dundee Naturalists' Society, entitled "The Grallatores and Natatores of the Estuary of the Tay; the great decrease in their numbers of late years; the causes; with suggestions for its mitigation. A paper read by Col. Drummond Hay." The author, whose long residence in the district alluded to renders his experiences doubly interesting, makes out a good case for his friends the birds in regard to their alleged destruction of fish and spawn, and no doubt some notice will be taken of his statements at the approaching Fisheries' Exhibition at Norwich. The principal cause in the decrease of the birds on the Tay he attributes chiefly to the increased number of gunners on the river, who disregard the close-season, while the wilful destruction of the sea-birds' eggs also plays sad havoc amongst their numbers. Drainage and cultivation of the land has also altered the conditions under which certain species nested, and has driven them further afield.

A Conference on the reform of the Educational Code is to meet in London in the third week in April, and to sit for two days, for the purpose of drawing up a series of recommendations, to be submitted in the form of a memorial to the Vice-President of the Committee of Council. The gentlemen invited to attend are persons conversant with the practical working of the public elementary school system, head-masters of secondary schools, persons experienced in education, and others interested. Invitations have been accepted by the chairmen of the Education and School Management Committees of the School Boards for London, Liverpool, Birmingham, Leeds, Sheffield, Bristol, Bradford, Leicester, and Nottingham; also by Dr. Abbott, Dr. Caldicott, Mr. Eve, Professors Max Müller, Carey Foster, Heurici, Gladstone, and Mekliejohn; Sir J. Kay-Shuttleworth, Sir. John Lubbock, the Rev. Mark Pattison, and numerous others.

Mr. Stephen Bretton, F.M.S., writes from Eastbourne to the *Times*, under date March 28, that he saw a meteor of great splendour that morning (1.15 a.m. Greenwich mean time), the finest he ever observed. Its size was apparently rather greater than Venus at her brightest, and for two or three seconds illuminated the heavens very brilliantly. Its colour was of an intense purple white, and moved somewhat slowly. He first noticed it a little south of Regulus, and going in direction of Castor. It immediately below Præsepe it burst into about five or six fragments, each about the size of a star of the third or fourth magnitude, these assuming a deep fiery red. It then immediately disappeared. The night was especially clear; temperature of air about 30°; barometer about 29·850.

The Committee of the "Frank Buckland Memorial Fund" have decided that the memorial shall take the form of a bust to be placed in the Fish Museum at South Kensington; the proceeds of an annuity to be presented to Mrs. Buckland; and, if there be any surplus, it will be applied in some way to promote the welfare of the fishermen of this country. The honorary secretaries are Col. Bridges and Mr. T. Douglas Murray, to whom subscriptions may be sent at 34, Portland Place.

Smart shocks of earthquake occurred at Agram on March 24 at 3h. 40m. a.m., duration three seconds, and on March 25 at 6h. 45m. a.m., both accompanied by loud subterranean noise.

There was another earthquake shock at Casamicciola on Sunday morning at 6.45.

M. van Malderen, who was the electrical engineer of the Alliance, and constructed the so long unrivalled magneto-electric machine belonging to this Company, died at Brussels at the age of seventy a few days ago.

All the obstacles which have prevented the reconstruction of the Sorbonne being accomplished, have been removed by M. Jules Ferry, and the work will begin immediately. The same may be said of the isolation of the Public Library of Paris, the required expropriations having been decreed.

The date for admission of exhibits to the International Exhibition of Electricity at Paris has been prolonged to April 15.

The Geologists' Association Easter Excursion will, as on Monday and Tuesday, April 18 and 19, to Salisbury, Stonehenge, and Vale of Wardour.

Colonel Paris, the head of the Paris fire brigade, has concluded his report on the destruction of the Printemps Establishment by proposing that large warehouses be compelled to light by electricity. The burning of the Nice Theatre, which was occasioned by a gas explosion, has given a new importance to that movement.

M. de Meritens has completed the construction of one of his magneto-electric engines intended for lighthouse illumination. An experimental trial took place on March 25 before MM. Becquerel, Cornu, Mascart, and other members of the Technical Commission of the International Exhibition. It was proved that with fifteen horse-power his machine illuminates at one more than thirty Jablochkoff lights, and that it could, at a moment's notice, be used in a regulator for marine purposes.

.—It appears that the object detected v Observatory of Vienna on the 23rd of last month, and which was announced as No. 220 of the small-planet group, may prove to be No. 139 *Juewa*, which had not been observed since 1874. It was discovered by the late Prof. Watson at Pekin on October 10 in that year, while he was engaged upon one of the United States expeditions for the observation of the transit of Venus, and as was reported at the time, without the aid of a chart of telescopic stars, but from his memory of their configuration about the particular spot occupied by the planet. It was observed on November 8 by Rumker at Hamburg, but the length of observation was not sufficient to determine the mean motion with any degree of accuracy; hence although the elements had been several times brought up to more recent dates by Watson, the planet had not been recovered up to last month.

By the last Berlin circular it would seem that *Irmene* will fall little short of *Hilda* in the length of its revolution, and these two minors will thus stand out as exceptional members of the group. By the latest elements the period of *Hilda* is 2860 days or 7·832 years, and that of *Irmene* 2854 days or 7·814 years.

Calculation has assigned the shortest period to No. 149 *Medusa*, but this awaits confirmation, perhaps in the next summer, when the planet should again come into opposition according to the imperfect elements at present available.

PHYSICAL NOTES

M. PLANTAMOUR continues to study with his sensitive levels the phenomena of periodic rise and fall of the ground which he has observed in Switzerland. He believes he has established a connection between these periods and those of the changes of temperature of the earth's surface, there being an annual change of level in an east-west direction corresponding with the mean temperatures of the surface during the year.

M. ROSENSTIEHL concludes from his researches on the sensations of colour recently noticed that the three fundamental colour sensations of the Young-Helmholtz-Maxwell theory correspond to the following tints of the pure spectrum. *Orange-red*, three-fourths of the distance from C to D amongst the Fraunhofer lines, a *yellow-green* three-quarters of the distance from D to E, and a *blue* situated at one-third from F towards G. The principle upon which this selection is made is that the selected tint fulfils the following conditions: (*a*) it is equidistant between two tints which are complementary to one another; (*b*) it produces with either of the other selected tints another colour having a minimum of white admixed with it. Thus the yellow-green chosen is midway between that yellow and that blue which produce the best white with one another, and it gives with the selected orange-red a yellow more intense than any known yellow pigment under equal illumination, and with the selected blue gives a green more intense than the richest green pigment.

M. HENRI BECQUEREL observes that the specific magnetism of ozone exceeds that of oxygen, and is much greater than could be accounted for by the difference in density of these two allotropic forms of the gas.

IN view of recent terrible colliery explosions in Belgium, M. Cornet has called attention (in the Belgian Academy) to a possible interference of winds, blowing in an inclined direction, with the proper ventilation of mines. Most of the "fiery" Belgian mines have two shafts, one for raising the coal and for descent of air, which, passing along the galleries, is drawn up the other shaft by a ventilating engine. The orifice of the latter shaft is generally (unlike that of the other) unsheltered by buildings; it debouches directly in the air a little above the ground. Obviously, then, a strong wind, blowing with downward inclination towards this orifice, might seriously affect the ventilating action. It is noted that one explosion in Hainaut on November 19, 1880, followed a night of very high wind, which M. Cornet shows to have been capable of depressing ventilation considerably. Mines with large sections are more dangerous than others to atmospheric perturbations. The true remedy, however (in the author's opinion), is not increasing the resistance to the air-currents, but sheltering the orifices of the ventilating shaft against descending winds.

IN a recent paper on the optical structure of ice (to the Freiburg Society of Naturalists) Prof. Klocke finds that while in the ice individuals the plane of the secondary axes is fixed by the position of the principal axis, they are subject to no law as to direction in that plane.

THE phenomenon of *vergiss* occurred at Urbino in Italy twice in January; and from his observations of it Prof. Serpieri con-

cludes (*Real. Ist. Lomb. Rend.*) that surfusion of the rain-drops is not indispensable to its production. Surfusion indeed accelerates it, as do also violence of wind and intense cold; but a rain with temperature not so low as zero falling into an air-current in rapid motion and below zero gives the phenomenon. It is pointed out, however, that the mist which usually accompanies verglas being driven against objects by the wind, and its particles being in a state of surfusion (the temperature being below zero), probably contributes to the general result, helping to make the ice-layer regular and uniform. If the verglas be such that the drop freezes wholly at once, the latter has probably contained many small crystals of ice.

M. MERCADIER sums up his researches on Radiophony by saying that he believes that the phenomena are due to a vibratory movement set up by the alternate heating and cooling, due to the intermittent beams of heat-rays, of the gaseous layer adjacent to the solid surface at which the radiations are absorbed; being an anterior layer in the case of solid bodies, a posterior layer in the case of transparent bodies.

M. JANSSEN has succeeded in photographing the *lumière cendrée*, or "earth-shine" on the moon when three days old: in the photograph the "continents" were to be distinguished clearly from the "seas." This disposes of the view sometimes advanced, and held, we believe, by some most eminent astronomers, that the "new moon in the arms of the old" was an optical illusion.

PROF. D. W. BEETZ, of the Technical High School of Munich, wishes us to say that in the note (vol. xxiii. p. 442) on the modulus of elasticity of rods of carbon, he, and not Herr Holtz, should have been mentioned as the author of the paper on the subject in *Wied. Ann.*

GEOGRAPHICAL NOTES

AT the meeting of the Geographical Society on Monday Mr. J. B. Minchin, who has spent some seven years in the country, read an excellent paper on Eastern Bolivia, which also included some observations on the Gran Chaco. After some preliminary remarks Mr. Minchin dwelt at length on the water-system of the country, and, speaking first of the lakes, he mentioned that between the Rivers Pilcomayo and Paraguay, in the unexplored Chaco, the Indians report the existence of a lake which no white man has ever yet seen, but which is perhaps near 22° S. lat. The rivers belong to Amazon and Plate systems, and with the exception of the Paraguay and the Itenez, they mostly have their sources among the highest summits of the Andes. The Parapite, Mr. Minchin added, is the most southerly affluent of the Amazons, which in some maps has been made to flow across the Chaco into the Paraguay. The Pilcomayo also does not, as has been thought, receive any tributaries on its course through the Chaco, so far as can be learned from the Indians. Mr. Minchin afterwards alluded to his expedition over the Matto Grossi Mountains, which he succeeded in crossing for the first time. The latter part of the paper was largely devoted to the animal and vegetable productions of Eastern Bolivia and to the commercial condition of the country. The discussion which followed turned chiefly on the route of the future into Bolivia, whether it would be most advantageous to follow the Paraguay route or develop a new one by the Madera.

MR. E. G. RAVENSTEIN has nearly completed for the Council of the Geographical Society the large map of Eastern Equatorial Africa, on which he has been engaged for nearly three years under the direction of their Scientific Purposes Committee. The original drawings will be reduced before they are engraved, and the map when published will be in twenty-four sheets, and on a scale of 1 : 1,000,000. It will take in the lake region, the Upper Congo, and the Upper Nile, and on the east coast will extend from Somali Land to a little south of the Zambesi, the precise limits of the map being from 10° N. to 20° S. lat., and from 25° to 52° E. long. A very complete bibliography of authorities, compiled *pari passu* with the map, will be published afterwards.

MR. BROUMTON, an agent of the China Inland Mission at Kweiyang-fu, in the province of Kweichow, has lately sent home an account of a visit which he had paid by invitation to the Miao-tsze tribes a short distance off. He had been told by one of them, from whom he had been learning something of the language, that in the third moon of the year his people had large gatherings in the hills, and was asked to be present at these festivities. He accordingly went and had an excellent opportunity for observing the manners and customs of this [illegible] this comparatively unknown people. He describes the character of the festivities witnessed, the singular instruments used, &c. The particular tribes visited by Broumton are known as the Black (from the colour of clothes) and the Ka-teo tribes, and live near Hwanging-[illegible]

MR. CARL BOCK is leaving for Siam next week, where he intends to make an excursion into the interior. His book "The Headhunters of Borneo," will be published shortly by Messrs. Sampson Low and Co.

WE hear that Mr. Edward Whymper, who has already given an account of some phases of his South American journey to the Alpine Club and the Society of Arts, will read a paper on the Andes of Ecuador before the Geographical Society on May 9.

PRIZES OF THE PARIS ACADEMY OF SCIENCES

AT the public *séance* of the Academy on March [illegible] annual distribution of prizes took place. While some of these prizes are offered for particular subjects, others are devoted to rewarding the most important advances made during the year in special departments of science.

The Grand Prize of the Mathematical Sciences was awarded to M. Halphen for work on the theory of linear differential equations.

In astronomy Mr. Stone receives the Lalande prize for his stellar researches, following those of Abbé de Lacaille at the Cape of Good Hope; and the Valz prize goes to M. [illegible] for his observations on comets. M. Vinot's labours in [illegible] and editing *Le Ciel* are recognised by the award of the Tremont prize.

The Montyon prize of the mechanical arts is given to M. Cornut for his study of the faults of iron plates; the Plumey prize to M. Leauté for various works; while a recompense of 1500 francs on the Bordin foundation is given to M. Le[illegible] improved modes of combustion, diminishing the trouble and harm from smoke, &c. (in steel heating). The economy prize of 6000 francs (for improving the efficacy of naval [illegible] and the Plumey prize, are not awarded.

In physics we find a recompense of 3000 francs given to M. Ader, on the Vaillant foundation, for improvements in [illegible] telegraphy. The grand prize for researches on elasticity of crystalline bodies is not awarded.

The Jecker prize goes to M. Demarçay for important work in organic chemistry; the Gegner prize to M. Jacquemin for skill in preparing a large number of substances in a pure state, &c.

Two prizes on the Bordin foundation are awarded in geology, one to M. Gosselet for a geological sketch of the North of France, the other to MM. Falsan and Chantre for their geological monography of ancient glaciers and erratic deposits in the middle of the Rhone Valley. Recompenses on the Gay foundation are awarded to MM. Delage and Chevremont for observations on movements of the coast-line in France.

In medicine and surgery three Montyon prizes are awarded, one to Dr. Charcot for his work on localisation of disorders in the brain; another to Dr. Sappery for researches on the [illegible] atic apparatus of fishes; the third to Dr. Jullien for important medical researches. On the Bréant foundation M. Colin receives 5000 francs for physiological researches. Dr. Segond receives the Godard prize for an important work in surgery; [illegible] Quinand the Barbier prize for researches on the quantity of oxygen in human blood in health and in disease. The Desportes prize (having regard to prevention of premature burial) is not given, but MM. Onimus, Peyrand, and Le Bon are recompensed for their researches. The Boudet prize is awarded to Dr. Lister.

In experimental physiology the Montyon prize is given to M. Bonnier for researches on the nectaries and colours of flowers.

The Fons-Melicocq prize for botanical research in the north of France is gained by M. de Vicq; and M. de la Chapelle receives 1000 francs on the Desmazières foundation for studies on [illegible] cryptogams.

In anatomy and zo[illegible] Prize with reference to distribution of marine [illegible] ach coast is withheld

e Savigny prize for researches on the Madagascar; while the Thorel prize is ss-ares and M. July, for observations otand in streams to be the larva of an phemeram.

r statistics goes to Dr. Rieoux for his f Algeria.

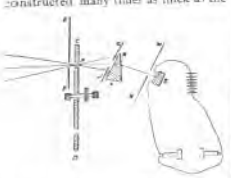
M. Birckel receives 1500 francs on the an improvement in the Davy lamp, gives the Delaland-Guerineau prize for in.

ubjects for prize competition in 1881, mprises the following subjects (briefly Motor for tramways; physiology of of environment on plant-organs; struc- ork; internal organisation of European ans; cure of Asiatic cholera; genito- of the theory of Jupiter's satellites; udies; origin of atmospheric electricity, nomena in thunderstorms; inoculation mestic animals; coloured parts of the animals, and fecundating matter of , lacustrine, and terrestrial deposits on e Roman epoch; botany of the North ns of death and prevention of premature

ON INDEX OF REFRACTION OF EBONITE[1]

at when an intermittent beam of light lenium cell the sound produced in a battery was attached to the selenium) d by interposing a thin sheet of ebonite ttent rays of light, or, in other words, y transparent for invisible rays that curred to us some months ago that if all of the nature of light, they probably assing through the ebonite, or that e if the sheet of ebonite were replaced ns, a result we have been able experi- at the same time to measure the index

ntrating a parallel beam coming from le it in a rapidly revolving brass disk constructed many times as thick as the



d, and have thus succeeded in eliminat- d by the syren action of the disk, so periments. c d is a stationary zinc maller than the holes in the rotating

as these intermittent rays on a selenium *ite* lens, and so determine the focal our lens was then not mounted on an e moved parallel to it-elf, or rotated d as the rays were invisible, so that our uide us as to the proper position in failed to succeed in this very delicate r our subsequent experiments, now to t ultimately succeed with the lens

the intermittent light which passed rotatory disk was allowed to fall on assing through a slit in a zinc screen e Royal Society by Professors Ayrton and o f, the slit being arranged parallel to the edge of the ebonite prism. The prism employed had an angle of 27°5. M N is another zinc screen with a slit in it also parallel to the edge of the prism, and placed in front of a sensitive selenium cell s (the cell described by us in the account of our experiments on "Seeing by Electricity"). This screen M N was moved parallel to itself, while an experimenter listened with a telephone to each ear, and who was placed in another room, so as not to be influenced by seeing what changes were being made in the position of the screen or in the position of the ebonite prism. The telephones had each a resistance of 74 ohms, and the battery an electromotive force of about 40 volts. No direct light falling on the selenium, the listener at the telephones heard nothing for the majority of positions of the screen M N, but in one position represented in the figure a faint distant sound was distinctly heard, which was entirely cut off by interposing the hand in front of the selenium, or by moving away the prism.

The invisible rays that affect selenium after passing through ebonite are consequently refracted, and some preliminary experiments, when the ebonite prism was arranged for minimum deviation, gave 1'7 as a first rough approximation for the index of refraction of these rays by ebonite. It is interesting to notice that the square, 2'89, of this index of refraction is between the highest and lowest limits obtained by different experimenters for the specific inductive capacity of ebonite, so far agreeing with Maxwell's electromagnetic theory of light.

We are now having prisms of ebonite and of other opaque substances of different angles mounted on a goniometer stand, to enable us to measure the indices of refraction accurately.

MOLECULAR ELECTROMAGNETIC INDUCTION[1]

THE induction currents balance which I had the honour of bringing before the notice of the Royal Society (*Proc. Roy. Soc.* vol. xxix. p. 56) showed how extremely sensitive it was to the slightest molecular change in the composition of any metal or alloy, and it gave strong evidence of a peculiarity in iron and steel which its magnetic properties alone failed to account for. We could with all non-magnetic metals easily obtain a perfect balance of force by an equivalent piece of the same metal, but in the case of iron, steel, and nickel it was with extreme difficulty that I could obtain a near approach to a perfect zero. Two pieces of iron cut off the same bar or wire, possessing the same magnetic moment, never gave identical results; the difficulty consisted, that notwithstanding each bar or wire could be easily made to produce the same inductive reaction, the time during which this reaction took place varied in each bar; and although I could easily change its balancing power as regards inductive force by a change in the mass of the metal, by heat or magnetism, the zero obtained was never equal to that obtained from copper or silver.

This led me to suppose the existence of a peculiarity in magnetic metals which could not be accounted for except upon the hypothesis that there was a cause, then unknown, to produce the invariable effect.

Finding that it would be impossible to arrive at the true cause without some new method of investigation, which should allow me to observe the effects from an electrical circuit, whose active portion should be the iron wire itself, I constructed an apparatus or electro-magnetic inducti n balance, consisting of a single coil reacting upon an iron wire in its axis, and perpendicular to the coil itself; by this means the iron or other wire itself became a primary or secondary, according as the current passed through the coil or wire. Now with this apparatus we could induce secondary currents upon the wire or coil, if the coil was at any angle, except when the wire was absolutely perpendicular; in this state we could only obtain a current from some disturbing cause, and the current so obtained was no longer secondary but tertiary.

The whole apparatus however is more complicated than the general idea given above, as it was requisite not only to produce effects, but to be able to appreciate the direction of the electrical current obtained, and have comparative measures of their value. In order to fully understand the mode of experiments, as well as the results obtained, I will first describe the apparatus employed.

The electro-magnetic induction balance consists—(1) of an

[1] Paper read at the Royal Society, March 17, by Prof. D. E. Hughes, F.R.S.

520 NATURE [March 31, 1

instrument for producing the new induction-current; (2) sonometer or balancing coils; (3) rheotome and battery; (4) telephone.

The essential portion of this new balance is that wherein a coil is so arranged that a wire of iron or copper can pass freely through and forming its axis, the iron or copper wire rests upon two supports 20 centims. apart; at one of these the wire is firmly clamped by two binding screws; the opposite end of the wire turns freely on its support, the wire being 22 centims. long, having 2 centims. projection beyond its support, in order to fasten upon it a key or arm which shall serve as a pointer upon a circle giving the degrees of torsion which the wire receives from turning this pointer. A binding screw allows us to fasten the pointer at any degree, and thus preserve the required stress the time required.

The exterior diameter of the coil is 5½ centims., having an interior vacant circular space of 3½ centims., its width is 2 centims.; upon this is wound 200 metres of No. 32 silk-covered copper wire. This coil is fastened to a small board so arranged that it can be turned through any desired angle in relation to the iron wire which passes through its centre, and it can also be moved to any portion of the 20 centims. of wire, in order that different portions of the same wire may be tested for a similar stress.

The whole of this instrument, as far as possible, should be constructed of wood, in order to avoid all disturbing inductive influences of the coil.

The iron wire at its fixed end is joined or makes contact with a copper wire, which returns to the front part of the dial under its board and parallel to its coil, thus forming a loop, the free end of the iron wire is joined to one pole of the battery, the copper wire under the board is joined to the rheotome and thence to the battery.

The coil is joined to the telephone; but, as in every instance we can either pass the battery through the wire, listening to its inductive effects upon the wire, or the reverse of this, I prefer, generally, in order to have no voltaic current passing through the wire, to join the iron wire and its loop direct to the telephone, passing the voltaic current through the coil.

In order to balance, measure, and know the direction of the new induction currents by means of a switching key, the sonometer (*Proc.* Roy. Soc., vol. xxix. p. 65) I described to the Royal Society is brought into the circuit. The two exterior coils of the sonometer are then in the circuit of the battery, and of the coil upon the board containing the iron wire or stress bridge. The interior or movable coil of the sonometer is then in the circuit of the iron wire and telephone. Instead of the sonometer constructed as described in my paper to the Royal Society, I prefer to use one formed upon a principle I described in *Comptes rendus*, December 30, 1878. This consists of two coils only, one of which is smaller and turns freely in the centre of the outside coil. The exterior coil being stationary, the centre coil turns upon an axle by means of a long (20 centims.) arm or pointer, the point of which moves over a graduated arc or circle. Whenever the axis of the interior coil is perpendicular to the exterior coil no induction takes place, and we have a perfect zero; by turning the interior coil through any degree we have a current proportional to this angle, and in the direction in which it is turned. As this instrument obeys all the well-known laws for galvanometers, the readings and evaluations are easy and rapid.

If the coil upon the stress bridge is perpendicular to the iron wire, and if the sonometer coil is at zero, no currents or sounds in the telephone will be perceived, but the slightest current in the iron wire produced by torsion will at once be heard; and by moving the sonometer coil in a direction corresponding to the current, a new zero will be obtained, which will not only balance the force of the new current, but indicate its value. A perfect zero however will not be obtained with the powerful currents obtained by the torsion of 2 millims. diameter iron wire; we then require special arrangements of the sonometer, which are too complicated to describe here.

The rheotome is a clockwork having a rapid revolving wheel which gives interruptions of currents in fixed cadences in order to have equal intervals of sound and silence. I employ four bichromate cells or eight Daniell's elements, and they are joined through this rheotome to the coil on the stress bridge, as I have already described.

The magnetic properties of iron, steel, nickel, and cobalt have been so searchingly investigated by ancient as well as by modern scientific authors, that there seems little left to be as regards its molar magnetism. I use the word molar simply to distinguish or separate the idea of a magnetic iron or steel magnetised longitudinally or transversely by polarised molecules which are supposed to produce its magnetic effects.

Molar magnetism, whilst having the power of inducing electric current in an adjacent wire, provided that there motion or a change in its magnetic force, as shown by Fa in 1832, has no power of inducing an electric current itself or its own molar constituent, either by motion or of its magnetic moment. Molecular magnetism (the new which I believe I have been the first to obtain) has no, or feeble, power of inducing either magnetism or an electric in an adjacent wire, but it possesses the remarkable pow strongly reacting upon its own molar wire, inducing (rel tively with its length) powerful electric currents, in a circ which this forms a part.

We may have also both cases existing in the same wire occurs when the wire is under the influence of stress, external or internal; it would have been most difficult to se these two, as it was in my experiments with the inductive b without the aid of my new method.

Ampère's theory supposes a molecular magnetism or pol and that molar magnetism would be produced when the mo lar magnetism became symmetrical; and his theory I believ fully capable of explaining the effects I have obtained. admit that we can rotate the paths of the polarised molecu an elastic torsion.

Matteucci made use of an inducing and secondary coil year 1847 (*Compt. rend.* t. xxiv. p. 301, 1847), by mean which he observed that mechanical strains increased or dimi the magnetism of a bar inside this coil.

Wertheim published in the *Comptes rendus*, 1852 (*Comptes* t. xxv. p. 702, 1852), some results similar to Matteucci in the *Annales de Chimie et de Physique*, 1857 (*Ann. de Chim. et Phys.* (3) t. l. p. 385, 3857), he published a long series of remarkable experiments, in which he clearly proves the exi ence of torsion upon the increment or decrement of a magne wire.

Vilari showed (*Poggendorff's Annalen*, 1868) increase diminution of magnetism by longitudinal pull according the magnetising force is less or greater than a certain cri value.

Wiedermann (Wiedermann's "Galvanismus," p. 447; remarkable work, "Galvanismus," says that an iron through which an electric current is flowing becomes magnet by twisting the wire. This I have repeated, but found the re very weak, no doubt due to the weak battery I use, viz quart bichromate cells.

Sir W. Thomson shows clearly in his remarkable contri to the *Phil. Trans.* Roy. Soc., entitled "Effects of Str the Magnetisation of Iron, Nickel, and Cobalt" (*Phil. Tr* May 6, 1878), the critical value of the magnetisation of metals under varying stress, and also explains the longitu magnetism produced by Wiedermann as due to the combin twist of the wire, making the current pass as in a spiral fixed centre. Sir William Thomson also shows clearly the e of longitudinal as well as transversal strains, both as regar molar magnetism and its electric conductivity.

My own researches convince me that we have in mag magnetism a distinct and separate form of magnetism from when we develop, or render evident, longitudinal or tra magnetism, which I have before defined as molar.

Molecular magnetism is developed by any slight strain other than longitudinal, and it is only developed by an twist; for however much we may twist a wire, provided fibres are not separated, we shall only have the result of reaction of its remaining elasticity.

If we place an iron wire, say 20 centims. long, 1 millim meter, in the axis of the coil of the electro-magnetic s and if this wire is joined, as described, to the telephone, that on passing an electric current through the inducing current is perceptible upon the iron wire; but if we give slight twist to this wire at its free end—one-eighteenth of a or 20°—we at once hear, clear and comparatively loud, rents passing the coil; and although we only gave a slight twist of 20° of a whole turn, and this spread over 20 centi length, making an extremely slight molar spiral; yet the are more powerful than if, using a wire free from

ed the whole coil 40°. The current obtained when we turn coil, as just mentioned, is secondary, and with the coil at angle any current produced by its action, either on a copper, r, iron, or steel wire; in fact it is simply Faraday's discovery, the current from an elastic twist is no longer secondary under same conditions, but tertiary, as I shall demonstrate later on. current passing through the coil cannot induce a current n a wire perpendicular to itself, but the molecules of the ide of the wire, being under a greater elastic stress than the itself, they are no longer perpendicular to the centre of the , and consequently they react upon this wire as separate nets would upon an adjacent wire. It might here be readily posed that a wire having several twists, so a fixed molar twist i given amount would produce similar effects. It however s not, for in most cases the current obtained from the molar its are in a contrary direction to that of the elastic torsion. is, if I place an iron wire under a right-handed elastic twist 20° I find a positive current of 50° sonometer; but if I tinue this twist so that the index makes one or several entire olutions, thus giving a permanent molar twist of several is, I find upon leaving the index free from any elastic ion, that I have a permanent current of 10°, but it is no ger positive but negative, requiring that we should give an tic torsion in the previous direction, in order to produce a itive current. Here a permanent elastic torsion of the mole- s is set up in the contrary direction to its molar twist, and we e a negative current, overpowering any positive current which uld have been due to the twisted wire.

The following table shows the influence of a permanent twist, l that the current obtained when the wire was freed from its stic torsion was in opposition to that which should have been duced by the permanent twist. Thus a well-softened iron e 1 millim. in diameter, giving 60° positive current for a ıt-handed elastic torsion of 20°, gave after 1°·80 permanent sion a negative current of 10°.

At this point the fibres of a soft wire commence to separate, l we have no longer a complete single wire, but a helix of arate wires upon a central structure.

If now, instead of passing the current through the coil, I pass through the wire, and place the telephone upon the coil cuit, I find that I obtain equally as strong tertiary currents on the coil as in the previous case, although in the first case ere was produced longitudinal electro-magnetism in the per- ndicular wire by the action of the coil, but in the latter case ne or the most feeble electro-magnetism was produced, yet in ese two distinct cases we have a powerful current produced t only upon its own wire, but upon the coil, thus proving that e effects are equally produced both on the wire and coil.

If we desire, however, in these reversible effects to produce in th cases the same electromotive force, we must remember that e tertiary current when reacting upon its own short wire oduces a current of great quantity, the coil one of comparative gher intensity. We can, however, easily convert the great antity of the wire into one of higher tension by passing it rough the primary of a small induction coil whose resistance not greater than one ohm. We can join our telephone, nich may be then one of a high resistance, to the secondary of is induction coil, and by this means, and without changing the sistance of the telephone, receive the same amount of force, ther from the iron wire or the coil.

Finding that iron, steel, and all magnetic metals produce a rrent by a slight twist, if now we replace this wire by one of pper or non-magnetic metals we have no current whatever by elastic twist, and no effects, except when the wire itself is isted spirally in helix; and whatever current we may obtain om copper, &c., no matter if from its being in spiral or from t being perpendicular to the axis of the coils, the currents tained will be invariably secondary and not tertiary. If we place the copper by an iron wire, and give it a certain fixed rsion, not passing its limit of elasticity, we find that no in- crease or decrease takes place by long action or time of being under strain. Thus a wire which gave a sonometric force of 50° at the first observation remained perfectly constant for several days until it was again brought to zero by taking off the strain it had received. Thus we may consider that as long as the wire preserves its elasticity, exactly in the same ratio will it preserve the molecular character of its magnetism.

It is not necessary to use a wire to produce these effects; still more powerful currents are generated in bars, ribbons, or sheets of iron; thus no matter what external form it may possess, it still produces all the effects I have described.

It requires a great many permanent twists in a wire to be able to see any effect from these twists, but if we give to a wire, 1 millim. diameter, forty whole turns (or until its fibres become separated) we find some new effects; we find a small current of 10° in the same direction as its molar twist, and on giving a slight twist (20°) the sonometric value of the sound obtained is 80° instead of 50°, the real value of a similar untwisted wire; but its explanation will be found by twisting the wire in a contrary direction to its molar twist. We can now approach the zero but never produce a current in the contrary direction, owing to the fact that by the spiral direction, due to the fibrous molar turns, the neutral position of its molecule is no longer parallel with its wire, but parallel with its molar twist, consequently an elastic strain in the latter case can only bring the molecules parallel with its wire, producing no current, and in the first case the angle at which the reaction takes place is greater than before, consequently the increased value of its current.

The measurements of electric force mentioned in this paper are all sonometric on an arbitrary scale. Their absolute value has not yet been obtained, as we do not, at our present stage, require any except comparative measures.[1] Thus, if each wire is of 1 millim. diameter and 20 centims. long, all render the same stress in the axis of its coil. I find that the following are the sonometric degrees of value:—

	°	
Soft iron	60	Tertiary current.
Hard drawn iron...	50	,, ,,
Soft steel	45	,, ,,
Hard tempered steel	10	,, ,,
Copper, silver, &c.	−0	,, ,,
Copper helix, 1 centim. diameter, 20 turns in 20 centims.	45	Secondary currents.
Iron, spiral, ditto	45	,, ,,
Steel	45	,, ,,

The tertiary current increases with the diameter of the wire, the ratio of which has not yet been determined; thus an ordinary hard iron wire of 1 millim. diameter giving 50°, one of 2 millims. diameter gave 100°; and the maximum of force obtained by any degree of torsion is at or near its limit of elasticity, as if in the same time we also pass this point, producing a permanent twist, the current decreases, as I have already shown in the case of a permanent twist. Thus, the critical point of 1 millim. hard iron wire was 20° of torsion, but in hard steel it was 45°.

Longitudinal strains do not produce any current whatever, but a very slight twist to a wire, under a longitudinal strain, produces its maximum effects: thus, 20° of torsion being the critical point of iron wire, the same wire, under longitudinal strain, required but from 10° to 15°. It is very difficult however to produce a perfect longitudinal strain alone. I have therefore only been able to try the effect of longitudinal strain on fine wires, not larger than 1 millim in diameter, but as in all cases no effect whatever was produced by longitudinal strain alone, I believe none will be found if absolutely free from torsion. The molecules in a longitudinal strain are equally under an elastic strain as in torsion, but the path of their motion is now parallel with its wire, or the zero of electric inductive effect, but the compound strain composed of longitudinal and transverse, react upon each other, producing the increased effect due to the compound strain.

The sonometer is not only useful for showing the direction of the current and measuring it by the zero method, but it also shows at once if the current measured is secondary or tertiary. If the current is secondary its period of action coincides with that of the sonometer, and a perfect balance, or zero of sound, is at once obtained, and its value in sonometric degrees given, but if the current is tertiary, no zero is possible, and if the value of the tertiary is 60°, we find 60° the nearest approach to zero

[1] 50° sonometer has the same electromotive force as 0°·10 of a Daniell battery.

possible. But by the aid of separate induction coils to convert the secondary into a tertiary, a perfect zero can be obtained if the time of action and its force correspond to that which we wish to measure.

If I place a copper wire in the balance and turn the coils at an angle of 45°, I obtain a current which can be perfectly balanced by the sonometer at 50°, proving, as already said, that it is secondary. If I now replace the copper by an iron wire, the coil remaining at 45°, I have again exactly the same value for the iron as copper, viz., 50°, and in both cases secondary. Now, it is evident that in the case of the iron wire there was produced at each passage of the current a strong electro-magnet, but this longitudinal magnetism did not either change the character of the current or its value in force.

A most beautiful demonstration of the fact that longitudinal magnetism produces no current, but that molecular magnetism can act equally as well, no matter the direction of the longitudinal magnetism, consists in forming an iron wire in a loop, or taking two parallel but separate wires, joined electrically at their fixed ends, the free ends being each connected with the circuit, so that the current generated must pass up one wire and down the adjacent one. On testing this loop, and if there are no internal strains, complete silence or absence of current will be found. Now, giving a slight torsion to one of these wires in a given direction, we find, say 50° positive; twisting the parallel wire in a similar direction produces a perfect zero, thus, the current of the second must have balanced the positive of the first. If, instead of twisting it in similar directions, we twist it in the contrary direction, the sounds are increased in value from 50° positive to 100° positive, showing, in this latter case, not only a twofold increase of force, but that the currents in the iron wires travelled up one wire and down the other, notwithstanding that both were strongly magnetic by the influence of the coil in one direction, and this experiment also proves that its molar magnetism had no effect, as the currents are equally strong in both directions, and both wires can double or efface the currents produced in each. If instead of two wires we take four, we can produce a zero, or a current of 200°, and with twenty wires we have a force of 1000°, or an electromotive force of two volts. We have here a means of multiplying the effects by giving an elastic torsion to each separate wire, and joining them electrically in tension. If loops are formed of one iron and one copper wire, we can obtain both currents from the iron wire, positive and negative, but none from the copper, its *rôle* is simply that of a conductor upon which torsion has no effect.

I have already mentioned that internal strains will give out tertiary currents without any external elastic strain being put on. In the case of iron wire these disappear by a few twists in both directions, but in flat bars or forged iron they are more permanent; evidently portions of these bars have an elastic strain, whilst other portions are free, for I find a difference at every inch tested: the instrument however is so admirably sensitive and able to point out not only the strain but its direction, that I have no doubt its application to large forged pieces, such as shafts or cannon, would bring out most interesting results, besides its practical utility; great care is therefore necessary in these experiments that we have a wire free from internal strains, or that we know their value.

Magnetising the iron wire by a large steel permanent magnet has no effect whatever. A hard steel wire thus placed becomes strongly magnetic, but no current is generated, nor has it any influence upon the results obtained from molecular movement, as in elastic torsion. A flat wide iron or steel bar shows this better than iron wire, as we can here produce transversal instead of longitudinal, but neither shows any trace of the currents produced by molecular magnetism. I have made many experiments with wires and bars thus magnetised, but as the effect in every case was negative when freed from experimental errors, I will not mention them; but there is one very interesting proof which the instrument gives, that longitudinal magnetism first passes through its molecular condition before and during the discharge or recomposition of its magnetism. For this purpose, using no battery, I join the rheotome and telephone to the coil, the wire having no exterior circuit. If I strongly magnetise the two ends of the wire, I find by rapidly moving the coil that there is a Faradaic induction of 50° at both poles, but very little or none at the centre of the wire; now fixing the coil at the central or neutral point of the wire and listening intently, no sounds are heard, but the instant I give a slight elastic torsion to the free pole, a rush of electric tertiary induction is heard, whose value is 40°. Again, testing this wire by [illegible] coil, I find only a remaining magnetism of 10, and [illegible] ing the experiment of elastic torsion I find a tertiary [illegible] we can go on gradually discharging the wire, but in [illegible] will be found to be a recomposition, and that it has [illegible] through the stage I have mentioned.

Heat has a very great effect upon molecular magnets [illegible] On iron it increases the current, but in steel the current is [illegible] ished. For experimenting on iron wire, which gives a [illegible] rent of 50° positive (with a torsion of 20°), upon the [illegible] the flame of a spirit-lamp the force rapidly increases [illegible] taken not to approach red-heat) until the force is [illegible] 100 positive. The same effects were obtained in steel [illegible] tion, and were not due to a molar twist or thermo-[illegible] care had been taken to put on not more than 10° of [illegible] wire came back to zero at once on removal of the [illegible] tempered steel, whose value was 10° whilst cold, with [illegible] of 45°, become only 1° when heated, but returned [illegible] much heated) to 8° when cold. I very much doubled [illegible] periment at first, but on repeating the experiment [illegible] several times I found that on heating it I had softened [illegible] treme hard (yellow) temper to that of the well-known [illegible] temper. Now at blue temper, hot, the value of steel [illegible] to 2°, whilst soft iron of a similar size gave 50° of [illegible] and 100° at red heat. Now as I have already shown [illegible] effects I have described depend on molecular elasticity, [illegible] tively perfect elastic body, such as tempered steel, has [illegible] molecular elasticity, and that heat reduces it, but that [illegible] having but little molar elasticity, has a molecular elasticity [illegible] very high degree, which is increased by heat.

The objects of the present paper being to bring the [illegible] mental facts before the notice of the Royal Society, and [illegible] give a theoretical solution of the phenomena, I will [illegible] that if we assume with Poisson that the paths of the [illegible] of iron are circles, and that they become ellipses by [illegible] or strain, and also that they are capable of being [illegible] would sufficiently explain the new effects.

Joule has shown that an iron bar is longer and narrower [illegible] magnetisation than before, and in the case of the [illegible] strain the exterior portions of the wire are under a [illegible] strain than those near the centre, and as the polarised [illegible] at an angle with the molecules of the central portions [illegible] wire, its polarisation reacts upon them, producing the [illegible] tively strong electric currents I have described.

although including fewer vertebræ. Its length is 7½ inches; its greatest breadth at the third vertebra, 5½ inches. The ilium forms the anterior and dorsal walls of the acetabulum, the posterior and postero-ventral walls of which are formed by the ischium and pubis. The diameter of its outlet is 3 inches, the depth of the cavity 1½ inch; at its bottom is a fossa 1¼ inch broad. The foramen is subcircular, 1 inch in diameter. The ventral wall of the pelvic outlet is chiefly formed by the pubis; it is a plate of bone 6 inches broad, concave externally, convex towards the pelvic cavity. The subacetabular border is 7-8 lines thick; it shows no indication of a pectineal process, or of a prominence for the support of a marsupial bone. The author remarks that of all examples of pelvic structure in extinct Reptilia this departs furthest from any modification known in existing types, and makes the nearest approach to the Mammalian pelvis. This is shown especially by the number of sacral vertebræ and their breadth, by the breadth of the iliac bones, and by the extent of confluence of the expanded ischia and pubes.—On the order Theriodontia, with a description of a new genus and species (*Elurosaurus felinus*, Ow.), by Prof. Owen, C.B., F.R.S. The new form of Theriodont reptile described by the author in this paper under the name of *Elurosaurus felinus* is represented by a skull with the lower jaw, obtained by Mr. Thomas Bain from the Trias of Gough, in the Karoo district of South Africa. The post-orbital part is broken away. The animal is monotrial; the alveolar border of the upper jaw is slightly sinuous, concave above the incisors, convex above the canines and molars, and then straight to beneath the orbits. The alveolar border of the mandible is concealed by the overlapping teeth of the upper jaw; its symphysis is deep, slanting backward, and destitute of any trace of suture; the length of the mandible is 3¼ inches, which was probably the length of the skull. The incisors are $\frac{5-5}{5-5}$, and the molars probably $\frac{5-5}{5-5}$ or $\frac{6-6}{6-6}$, all more or less laniariform. The length of the exserted crown of the upper canine is 12 millims.; the root of the left upper canine was found to be twice this length, extending upwards and backwards, slightly expanded, and then a little narrowed to the open end of the pulp-cavity. There is no trace of a successional canine; but the mandibular of the pulp-cavity and petrified pulp would seem to indicate renewal of the working part of the canine by continuous growth. The author infers that the animal was monophyodont. *Elurosaurus* was said to be most nearly allied to *Lycosaurus*, but its incisor formula is Dasyurine. With regard to the characters of the Theriodontia the author remarked that we may now add to those given in his "Catalogue of South African Fossil Reptiles" that the humerus is perforated by an entepicondylar foramen and the dentition monophyodont.—Additional observations on the superficial geology of British Columbia and its adjacent regions, by G. M. Dawson, D.Sc. This paper is in continuation of two already published in the Society's *Journal* (vol. xxxi. p. 603, and vol. xxxv. p. 89). In subsequent examinations of the southern part of the interior of British Columbia the author has been able to find traces of glaciation in a north to south direction as far as or even beyond the 49th parallel. Iron Mountain, for instance, 3500 feet above the neighbouring valleys, 5280 feet above the sea, has its summit strongly ice-worn in direction N. 29° W. to S. 29° E. Other remarkable instances are given which can hardly be explained by local glaciers; boulder-clay is spread over the entire district; terraces are cut in the rearranged material of this, bordering the river-valleys, and at greater elevations expanding over the higher parts of the plateau and mountains. At Mount Ita-cha-chay they are 5270 feet above the sea. The author considers that the higher terraces can only be explained by a general flooding of the district. Some of the wide trough-like valleys of the plateau contain a silty material which the author regards as a glacial mud. North of the 54th parallel and west of the Rocky Mountains similar evidence of glaciation is obtained; erratics are found in the Peace and Athabasca basins. The fiords of British Columbia are extremely glaciated, the marls being generally in conformity with the local features; terraces are scarce and at low levels. The Strait of Georgia was filled by a glacier which overrode the south-east part of Vancouver's Island; evidence is given to show that this ice came from the neighbouring mountainous country. Queen Charlotte's Island shows evidence of local glaciation. Boulder-clays and stratified drifts are found, with occasional Arctic shells. The author considers that the most

probable explanation of the phenomena of the whole region is to suppose the former existence of a great glacier mass resembling the inland ice of Greenland, and that the Glacial period was closed by a general submergence, during which the drifts were deposited and, at its close, the terraces cut.

Photographic Society, March 8.—J. Glaisher, F.R.S., president, in the chair.—Papers were read by Mr. Payne Jennings on art photography. It was asserted that unfavourable criticisms, both from artists and the press, had been the result from the exhibition of works which deserved such severity, and that to raise the status of art in photography more attention must be given to art-rules.—Also by Mr. Edwin Cocking, on notes on photography and art. An incisive comparison was drawn between the art of the painter and that of the photographer, showing the essential difference between the two in the production of a pictorial work, both in the *modus operandi* of production and the individuality capable of being infused into each result. Also that art in photography required a totally different training to that necessary for the painter, and that the time had arrived when special instruction by a thoroughly organised school for art photography had become absolutely necessary.

Institution of Civil Engineers, March 22.—Mr. Abernethy, F.R.S.E., president, in the chair.—The paper read was on the comparative endurance of iron and mild steel when exposed to corrosive influences, by Mr. D. Phillips, M. Inst. C.E.

FLETCHER'S

PATENT VENTILATED

HOT-AIR OVEN.

At a cost of less than one halfpenny per hour for gas this oven will grill, roast, toast, bake, warm dishes and plates; and with the assistance of Fletcher's Patent Solid Flame Boiling Burners will do everything possible with a first-rate open fire (except drying clothes on washing days).

It is unapproached by any oven for pastry, and is fully hot in one minute after the gas is lighted.

Fish, joint, and pastry can be cooked all at once, in the most perfect manner, without the slightest taint from one to the other. The cooking is always good and always alike.

It will roast joint and fowls both at once, at least as well as an open fire.

Complete illustrated list of gas cooking and labour-saving appliances free by post. List of Gas and Petroleum Laboratory Furnaces and Apparatus, price 2d.

A TEXT-BOOK OF THE

SIOLOGICAL CHEMISTRY OF THE ANIMAL BODY,

INCLUDING

N ACCOUNT OF THE CHEMICAL CHANGES OCCURRING IN DISEASE.

By ARTHUR GAMGEE, M.D., F.R.S.,

Professor of Physiology in the Victoria University, the Owens College, Manchester.

LONDON: MACMILLAN AND CO.

s work, of which the first volume is now published, and of which the second and concluding volume will be published in ns at giving a more complete account of the present state of physiological and pathological chemistry than is to be found f the existing text-books. The special features of the work are the following:—

st.—Physiological Chemistry is treated of from the points of view of the physiologist and physician rather than from that of : chemist, although no chemical fact and even no chemical speculation is omitted which appears to throw any light upon a al question. The classification adopted is, however, based upon physiological and pathological rather than chemical ations.

ondly.—It has been sought to combine a thoroughly systematic treatment of each subject with a full description of those methods rch which have in the past proved of the greatest value to the investigator. In the pursuit of this aim, detailed accounts are f methods which have, in many cases, hitherto been only incidentally referred to by the systematic writer. It seemed the portant to do this in a work intended for the scientific worker, anxious not merely to learn what had been already acquired ce, but wishful himself to extend her boundaries. Methods of analysis are described with great care, so as to render the work rorthy laboratory guide for the student of physiological chemistry and the practical physician.

irdly.—The history of each subject treated of is dwelt upon with great thoroughness, a detailed account of all epoch-making es being given, and the full titles of nearly all papers quoted being given.

urthly.—The work is copiously illustrated, the illustrations being in many cases original.

fthly.—Whereas in the first volume the chemical composition of and the chemical processes connected with the elementary of the organism are mainly dwelt upon, the second volume will deal with the chemical history of the complex animal es.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist

Price 3d. By post 3½d. Annual Subscription, payable in advance, 14s.

Office—377, High Street, Edinburgh.

Post-Office Orders payable to Charles Anderson, Jun., Edinburgh.

ESTABLISHED 1843.

Now publishing in Crown 8vo, price 2s. 6d. each.

ENGLISH MEN OF LETT

EDITED BY JOHN MORLEY.

JOHNSON. By Leslie Stephen.

"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette.*

SCOTT. By R. H. Hutton.

"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. Morison.

"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. Symonds.

"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Prof. Huxley, F.R.S.

"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum.*

GOLDSMITH. By William Black.

"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings, as well as his sketch of the incidents of his life."—*Athenæum.*

DEFOE. By W. Minto.

"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests. It will repay reading more than once."—*Athenæum.*

BURNS. By Principal Shairp.

"None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the Dean of St. Paul's.

"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By Anthony Trollope.

"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By John Morley.

"Perhaps the best criticism yet published on the life and character of Burke is contained in Mr. Morley's compendious biography. His style is vigorous and polished, and both his political and personal judgment, and his literary criticisms, are just, generous, subtle, and in a high degree interesting."—*Saturday Review.*

MILTON. By Mark Pattison

"Every page gives us something new to old put in such a way as to be almost equiv is new."—*Academy.*

HAWTHORNE. By Henry

"Probably no one living could have done Hawthorne as Mr. James has done."—*Satu*

SOUTHEY. By Prof. Dowd

"A truly scholarly and delightful ma writer, who has been of late years undeser *Examiner.*

CHAUCER. By A. W. War

"An enjoyable and excellent little bo Ward's. Far away the best connected acco his work to be found in English."—*Academ*

COWPER. By Goldwin Smi

"Mr. Goldwin Smith has sketched, touches, the genius of the poet and weak *Daily News.*

BUNYAN. By J. A. Froude.

"The life and character of Bunyan stand and for the first time the author of the 'P portrayed as he really existed."—*Westminst*

BYRON. By John Nichol.

"Decidedly one of the most careful whole series. When a book is so good as is little to be said about it, except to recom may be."—*Athenæum.*

LOCKE. By T. Fowler.

"In the case of Locke's biographer we Mr. Morley has been exceptionally fortu competent than Prof. Fowler's for this pa have been sought, and sought in vain."—*E*

POPE. By Leslie Stephen.

"The sketch of Pope's life which Mr. written is interesting throughout. . . . A only lay down with the wish to have a goo same subject by the same hand."—*Academy.*

WORDSWORTH. By F. W

"Mr. Myers gives us a picture of the m of his work which is certainly not inferior has preceded it. . . . Possibly the best cha every chapter of which is excellent—is that o —*Academy.*

DRYDEN. By George Saints

*** **Other Volumes to follow.**

MACMILLAN AND CO., BEDFORD STREET, COVENT GARDEN, W

With Illustrations and Maps, medium 8vo, 18*s*.

ISLAND LIFE:

THE PHENOMENA AND CAUSES OF INSULAR FAUNAS AND FLORAS, INCLUDING A REVISION ATTEMPTED SOLUTION OF THE PROBLEM OF GEOLOGICAL CLIMATES. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c.

Mr. Wallace discusses in an admirably clear and able manner the questions of geological climate and time . . . such are few of the great problems discussed in this most instructive volume—a volume that ought to interest every thoughtful reader. its theories are likely to meet with keen criticism from Mr. Wallace's fellow-scientists, his volume ought more than any other ow of to spread among the intelligent reading public a knowledge of and interest in some of the most momentous scientific ms of our time."—*Times*.

His wonderful grasp of detail, depth of insight, and breadth of view remind one at every turn of Darwin, with whom he the honours of discovery in the theory of natural selection; but beyond this he has a lightness of touch, a beauty of style, ingenuity in unravelling intricate difficulties which are all his own. . . . 'Island Life' is a work to be accepted almost it reservation from beginning to end. . . . Whoever reads his book must be charmed with it."—*St. James's Gazette*.

The work throughout abounds with interest. . . . It may be read with equal pleasure by those who are already acquainted he general principles of distribution and by those who wish for the first time to learn something about modern biological phy."—*Athenæum*.

We have said enough to show that Mr. Wallace is led to discuss subjects of great interest to speculative minds. With its ous special maps 'Island Life' ought to prove as interesting as it is instructive."—*Pall Mall Gazette*.

MACMILLAN AND CO., LONDON.

A HANDBOOK OF DOUBLE STARS.

a Catalogue of Twelve Hundred Double Stars, and extensive Lists of Measures. With additional Notes bringing the ires up to 1879. For the use of Amateurs. By EDWARD CROSSLEY, F.R.A.S., JOSEPH GLEDHILL, F.R.A.S., AMES M. WILSON, M.A., F.R.A.S. With Illustrations. 8vo. 21*s*.

Just ready. 44 pages 8vo. 1*s*.

RRECTIONS, TOGETHER WITH NOTES, CRITICISMS, RECENT MEASURES AND DISCOVERIES, &c., &c., TO THE HANDBOOK OF DOUBLE STARS.

THE BIBLIOGRAPHY HAS ALSO BEEN BROUGHT UP TO DATE.

he volume is one which may be expected to find its way to the shelves of most amateurs and students of astronomy."—*Nature*.
his is a truly delightful work, and one which will admirably supply a want. Into the hands of abler, more impartial and aking observers and compilers than the authors' its preparation could not have fallen."—*The Astronomical Register*.
/ill be welcomed by all who take an interest in the subject of double stars."—*Acaaemy*.
he names of the authors, noted authorities on the subject treated of, will lead the reader to open this volume with the feeling i it he has a treasure of lore on the knowledge brought to light in the last hundred years respecting the relative motions of ally connected stars, nor will he be disappointed."—*Athenæum*.
ne of the most valuable additions to the library of the amateur astronomer that has been made for many years. It is full of iation of perennial interest to the student and the practical observer, and assuredly ought to be upon the table of every single atory in the United Kingdom, and of all those in other parts of the world where the language in which it is written is ible."—*The English Mechanic*.
he book is well and clearly printed, and we heartily recommend it to our readers as a most valuable contribution to the ire of double-star astronomy."—*The Observatory*.

MACMILLAN AND CO., LONDON.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The SUMMER SESSION will commence on May 2nd. Students entering in summer are eligible to compete for the Natural Science Scholarships of £100 and £60 awarded in the following October.

Special Classes are held for the Matriculation, Preliminary Scientific, and 1st M.B. of the University of London.

There are numerous Prizes and Scholarships, and all Appointments are open to Students without extra payment.

Several Medical Practitioners and Private Families in the neighbourhood receive Students for residence and supervision, and a register of inspected lodgings is kept in the Secretary's office.

Prospectuses and all particulars may be obtained from the Secretary, Dr. Gillespie.

W. M. ORD, M.D., Dean.

THE MIDDLESEX HOSPITAL MEDICAL SCHOOL.

SUMMER SESSION, 1881.

Lectures and Clinical Instruction in the Wards will commence on May 2nd. Gentlemen can enter to any one Course or to Hospital Practice only.

TWO ENTRANCE SCHOLARSHIPS, of the annual value of £35 and £20 respectively, tenable for two years, and a SCIENCE SCHOLARSHIP value £50, will be offered for competition at the beginning of the Winter Session.

For Prospectus, containing particulars as to other Scholarships, Resident Appointments, Fees, &c., apply to the Dean or the Resident Medical Officer, at the Hospital.

ANDREW CLARK, Dean.

UNIVERSITY COLLEGE, NOTTINGHAM.

The Town Council of Nottingham have resolved to APPOINT FOUR PROFESSORS as follows:—

ONE PROFESSOR who shall undertake one or more of the following Subjects:—Classics, Literature, History, Political Philosophy, Moral Science; and

THREE PROFESSORS who shall each undertake one or more of the following Subjects:—Mathematics (including Theoretical and Applied Mechanics), Physics, Chemistry, Physiology, Biology, Geology.

The work of the College will be divided into FOUR DEPARTMENTS, whose arrangement will depend to some extent on the subjects undertaken by the Professors elected, but it is intended that the three Scientific Departments shall severally comprehend—

1. Mathematics and Mechanics,
2. Chemistry,
3. Natural Science,

and that the subject of Physics shall be placed as a subject of principal importance in one or other of those Departments.

Applicants are invited to specify the Subjects which they would be prepared to undertake. Applications for the above Appointments to be addressed to the Town Clerk, Municipal Offices, Nottingham, endorsed "University College," on or before the 7th day of May next. Particulars of Salaries, Duties, and Conditions will be sent upon application to the Town Clerk.

Candidates are especially requested to abstain from canvassing.

SAM. GEO. JOHNSON, Town Clerk.

Municipal Offices, Nottingham, 22nd March, 1881.

THE COUNCIL OF FIRTH COLLEGE, SHEFFIELD,

intend to APPOINT a PRINCIPAL, who shall also be Professor either in the Literary or in the Mechanical Department of the College.

These Departments will comprehend respectively the following Subjects:—

1. Classes, History, Literature, Political Economy, Moral Science.
2. Mathematics, Mechanics, Engineering, Geology, Physics.

Applicants are requested to state in which of these Departments they would be prepared to act as Professor, and which of the Subjects in that Department they would be prepared to undertake.

The Salary of the said Principal will be £500 per annum, with Half the Fees of his own Classes.

The Council will only make the Appointment in event of suitable Candidates presenting themselves.

Candidates are requested to give full particulars concerning Age, Experience, and any Academical Distinctions they may have gained, together with any other information likely to affect the decision of the Council. The names of three gentlemen to whom references may be made should be given, but no testimonials need be sent unless they are asked for.

Applications to be sent on or before the 25th day of April next, to

ENSOR DRURY, Registrar.

Firth College, Sheffield, March 24, 1881.

INSTRUCTION IN MATHEMATICS.—

Youths or Adults attended at their Residence, on Reasonable Terms, by a M.A. of Cambridge. Unquestionable references if required.—Address, by letter, O. P., Post Office, Turnham Green.

LIVING SPECIMENS FOR THE MICROSCOPE

THOMAS BOLTON, NATURALISTS' and MICROSCOPICAL STUDIO, 57, NEWHALL STREET, BIRMINGHAM.

T. B. has last week sent to his subscribers a Collection of Freshwater Rotifers, including *Amœrura acuminata*, *Brachionus urceolaris*, and many others, with *Panderina morum* and Diatoms. He has also sent out *Floscularia charis* thickly encrusted with tube-dwelling Rotifers, including *Melicerta ringens*, *Limnias ceratophylli*, *Floscularia cornuta*, and *Cothurnia*, also commensal upon them.

Weekly announcements will be made in this place of organisms he is supplying.

Specimen Tube, One Shilling, post-free.

Twenty-six Tubes in course of Six Months for Subscription of £1.

Price List of Specimens on application, with stamped addressed envelope.

Portfolio of Drawings, No. 4, One Shilling.

"THE ENDOWMENT OF RESEARCH."

See Front Page of NATURE of March 24.

Letter from the Rev. THOMAS P. KIRKMAN, M.A., F.R.S.

"Croft, near Warrington, March 26, 1881.

"MY DEAR SIR,—Many thanks for your Fifth Report. I have read the inclosed papers with great pleasure.

"I wish you could get some Medical Man to look through the papers of the Vivisectors, and bring out the evidence that shows that they have *no clear question proposed* for solution. They are not for answers to scientific questions, but for hints how to frame questions. What a horrible thing it is that after three thousand years of as they dared), they have really nothing to show for a result, saving carving living men and animals (they Vivisected slaves innocently as B. has always found it easy and glorious to prove that Dr. A. was a blunderer; while neither B. nor A. ever yet had a sensible question of him which he could show likely to be solved by Vivisection. The Vivisectors have Benevolent and Scientific Aims. I don't believe it for all the as their Fathers ever were, under the false impression that these and Greek compounds. They carve away in the vain hope that the new will turn up for them to shine about, while hitherto they have done nothing which they could not find or infer from anatomy and physiology of health and disease. Any scientific thinker can satisfy himself of the of my remarks by a logical examination of their papers.

"Sincerely yours,

"THO. P. KIRKMAN.

"P.S.—You have given a capital account of all your antagonists.

(Harrwitz & Gossmann.)

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continents of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist.

Price 3*d.* By post 3½*d.* Annual Subscription, payable in advance, 14*s.*

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

*** Upwards of 150,000 Vols. of this series have been sold.

WORDSWORTH. By F. W. H. MYERS.

"Mr. Myers gives us a picture of the man and an estimate of his work which is certainly not inferior to anything that has preceded it."—*Academy.*

LOCKE. By Prof. FOWLER.

"In the case of Locke's biographer we venture to say that Mr. Morley has been exceptionally fortunate. A pen more competent than Prof. Fowler's for this particular work might have been sought, and sought in vain."—*Examiner.*

BYRON. By Prof NICHOL.

"Decidedly one of the most careful and valuable of the whole series."—*Athenæum.*

POPE. By LESLIE STEPHEN.

"The writer's eminent qualities as a critic, his judgment, his wit, his abundant knowledge of eighteenth-century literature, and his keen enjoyment of literary form, have equipped him handsomely for the task he has undertaken."—*St. James's Gazette.*

COWPER. By GOLDWIN SMITH.

"Mr. Goldwin Smith has sketched, in a few decisive touches, the genius of the poet and weakness of the man."—*Daily News.*

CHAUCER. By Prof. A. W. WARD.

"Far away the best connected account of Chaucer and his works to be found in English."—*Academy.*

BUNYAN. By J. A. FROUDE.

"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum.*

SOUTHEY. By Prof. DOWDEN.

"A truly scholarly and delightful monograph."—*Examiner.*

HAWTHORNE. By HENRY JAMES, JUN.

"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made."—*New York Nation.*

MILTON. By MARK PATTISON.

"Mr. Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator.*

JOHNSON. By LESLIE STEPHEN.

"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette.*

SCOTT. By R. H. HUTTON.

"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. MORISON.

"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. SYMONDS.

"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Prof. HUXLEY, F.R.S.

"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum.*

GOLDSMITH. By WILLIAM BLACK.

"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings."—*Athenæum.*

DEFOE. By W. MINTO.

"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests."—*Athenæum.*

BURNS. By Principal SHAIRP.

"... None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the DEAN OF ST. PAUL'S.

"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By ANTHONY TROLLOPE.

"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By JOHN MORLEY.

"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review.*

*** *Others in Preparation.*

'YAN VILLAGE

India and Ceylon. By Sir John Macmillan and Co., 1880.)

since a remarkable page in Sir ancient Law" drew attention to f the village-community, a system modern English mind. Before special students had little idea munism, under which the Aryan of Asia and Europe, was still to elic of ancient society, but as the ndern life among Hindus and portance of this early institution and our archæologists are alive village-communities in England. in the public commons, but here fields where, after harvest, the right of turning their cattle in le even a few of the great old once each family had its free to be discerned by the baulks ur hem into the three long strips, swise into the family lots. Thus argument on the development of the communism of ancient times.

The present volume is such a al ways new and important. Sir describes and carefully describes Ceylon, and one of his points is n of the agricultural village, as it two widely-separated districts. the development of the village. ywhere on much the same lines, ce. It springs naturally out of which, living together on its in common, and subsisting on a few generations a family- now to be seen in and about o 400 (including servants) living 100 is a usual number. The the *father*, who as usually the s, and what the members want ouside the common board and ave in small sums out of the l; then there is a great quarrel, ke up and the land is divided easily seen how such a joint- lies settling together in waste parcel into a village-community, hen crowded out of the family ared by, but all would work and still dwell under one roof. In of village settlement, according ng on at this day in Ceylon. In ent Europe, patches of forest are give a couple of years' crop of wlands rice-cultivation requires ul the whole settlement at work dly socialistic way. The some-

what different communistic system prevails more in India, where the land is still the common property of the village, and the cultivated plots are apportioned out from time to time among the families, but these families labour by and for themselves, pay the rent or tax, and live each on the crop of their own raising. In Bengal a step toward our notion of proprietorship is made, where custom more and more confirms each family in permanent ownership of the fields which their fathers have long tilled undisturbed. Tenant-right, so pertinaciously remembered by the Irish peasant, is older in history than the private ownership of land. Next, in the Hindu village as it now exists, a further stage of social growth appears. Families carrying on certain necessary professions have been set apart, or have settled in the village. The hereditary carpenters and blacksmiths and potters follow their trades, the hereditary washerman washes for his fellow-villagers, and the hereditary barber shaves them, paid partly for their services at fixed customary rates, and partly by having their plots of village-land rent free, or nearly so. All this is intelligible and practical enough, and indeed strongly reminds those of us who got our early politics out of "Evenings at Home," of the boy colonists providing for their future wants under the direction of discreet Mr. Barlow, by taking with them the carpenter and the blacksmith and the rest of the useful members of society. But the village-community as it actually exists in India, or Servia, or anywhere else, only forms the substratum of society, on the top of which appear other social elements whose development it is not so easy to trace with certainty. The "gentleman," with his claims to live in a better house than the others whose business is to drudge for him, seemed absurd to Dr. Aikin's political economy, yet he makes his appearance in the Hindu village-community as elsewhere. Sir John Phear seems disposed partly to account for what may be called the landholding class, as well as the endowed priesthood, as having held a privileged position from the first settlement of the villages, and it is in favour of this view that in such settlements the founder's kin naturally have superior rights over the land to new-comers. But he does not the less insist on another and yet stronger social process which has tended to give to individuals a landlord-right over fields they do not till. When quarrels between two villages end in actual war, the conquering warriors (whose claims however seem to be here somewhat confused with the rights of the chief's family) would be rewarded for their prowess by grants of land carved out of the common lands of the conquered village, and the new lords being absentees would naturally put in tenants who would pay in return a share of the crops. Such metayage, or farming "on shares," is as common in India as in the south of Europe, and is evidently the stage out of which arose our rent-system of landlord and tenant.

One great value of books like the present is in showing the analogies and differences of social institutions which have much of their history in common with our own, but have developed under other conditions. Feudal lordship and feudal sovereignty have in the East overridden the old village-system in ways curiously like those of the West. Thus, as Sir John Phear says, the English manor was the feudal form of the Oriental village; the Bengal

zamindar collects rents from his ryots and pays to the superior holder, or the Crown, living on the difference. Singhalese villagers may do suit and service either to a feudal chieftain or a Buddhist monastery, much as in England the fief might have been held either by a fighting baron or a praying abbot. It is interesting to find in Ceylon the notion that the existing tenure of land comes from the king having granted it subject to service, whereas its real history seems just the opposite, that the village-community came first, which the sovereign made himself paramount over and levied land-tax from. This reminds us of the theory of English law, that a cottager pastures his donkey on the common by sufferance of the lord of the manor, whose waste it is; the fact being that the peasant is exercising a relic of his old village-rights which has escaped the usurpation of the feudal system, and outlived it.

Though the village-community is much broken down in the districts so well described by Sir John Phear, it still shows the old framework in the division of the tilled land in allotments to each ryot, and the equitable settlement of rights and duties by the *mandal* or headman and his *panchayat* or village-council, which is one of the most admirable features of the ancient patriarchal system. But on the whole the village commune here shows practical results by no means admirable, and the husbandman's life on the roadless mud-flats of Bengal, minutely drawn by the author in all its details of dreary poverty and ignorance and hatred of improvement, is about as depressing a social picture as can be met with.

EDWARD B. TYLOR

NILE GLEANINGS

Nile Gleanings. By Villiers Stuart of Dromana, M.P. (London: John Murray, 1879.)

THE land of Egypt has of late caused the issue of a multitude of books, and that in consequence of the increased knowledge which half a century of Egyptian research has produced. Classical authorities no longer avail the traveller; he requires translations from the original hieroglyphic inscriptions, an insight into the discovery of a new world of antiquity and an acquaintance with the recent excavations which have revealed to the eye of the traveller an unveiled city of the dead. Scriptural texts alone garnished the older voyages. Above all the accomplished traveller should be acquainted with the various sciences which enable him to detect what is new or salient in the country that he visits, and its development, political institutions, progress, or decay should be seen at a glance even if it demands pages to describe them. The grand Egyptian tour is however a promenade of the land of monuments. Mr. Villiers Stuart's "Nile Gleanings" follow the usual track, and offer to the archæologist, besides the usual discussions on art, hieroglyphs, and language, and an occasional notice on the fauna and flora of Egypt, several new facts of archæological interest. At the description of Meidoum, the period of which is now known to be that of Senofrou, the tomb of Nofre Maat, with its strange figures inlaid with incrustations of red ochre, is new and interesting for its peculiar art and its remote age of the third dynasty; nor less important is the discovery of the flint flakes, the *débris* of the old chisels which sculptured it. Other tombs at the spo remarkable for their gigantic masonry. These r indeed to the more recent discoveries, but the a paid his respects to the dog mummy pits at Beb sites of Minieh and Dayr-el-Nakel. Considerable attaches to the heretical worshippers of the su who flourished about the close of the eighteenth dy and who endeavoured to remove the capital of Egy Thebes with "its hundred gates," to Tel-el-Am Psinaula. The idea fashionable amongst Egyp has been that Amenophis III. of that line, the b of whose statues is the celebrated vocal Mem menced an attempted religious reform and inst stitute the worship of the sun's disk or orb, the Ate is called, for that of the god Amen-Ra, or the hi To this it is supposed that he was invited by the influence of his wife, Tai or Taiti. After his dea conjectured that he was succeeded by his brother ophis IV., and that this Amenophis IV. was a co the most pronounced zeal for the worship of the s or pure Sabæanism. For this purpose, from the hept, or the Peaceful Amen, he changed his na Khuenaten, the Light or Spirit of the Sun. The de for this arrangement of the monarchs of the pen eighteenth dynasty were the stones used for the co tion of the Pylon or gateway of Haremheb a of the same dynasty, which were found to ha taken from an edifice of the so-called disk wor Thebes, and built with their faces inside the wall ing the erasure of the name of Amenophis IV substitution of Khuenaten in the cartouches for phis. Some objections indeed might have be from the fact that the features of Amenophis and aten were different, it being of course facile to new faith, impossible to secure fresh features, even enviable ones as those of Khuenaten. Mr. Villiers discovered a new tomb at Thebes, with Amenoph his queen on one side of the door and Khuenaten queen on the other, both dissimilar in features ment, and condition—one perfect, the other As both sovereigns could hardly have occupied the sepulchre, evidently one of the two appropriated by struction of his predecessor. The theory of Mr Stuart is that Khuenaten was a foreigner, which always asserted, although it is more difficult to de which of the races of mankind he belonged; the however some reasons to believe that after all h come from Nubia or the South. The discover tomb is in fact the principal new point of the work the one new and important contribution to the history of the heretical division which took place the thirteenth century B.C.

The various sites of Esneh, Dendera, Assouan and the Nubian temples are well known, but are des in a light and graceful way, and much old materia duced in a polished and not pedantic form. Necess a great deal is already well known to the student, a inconsiderable portion to the general public. A chronology the numerous systems and theories have been started, amounting in all to above one any choice which suits best the proclivities of the re The present work has a new date for Rameses I throws his reign back to B.C. 1567, but it is difficult

ble to reconcile a period so exalted with the ceiling
o-called Memnonium and the date of the heliacal
of the dog-star on the calendar of Thothmes III.
hantine. Every fact connected with the Exodus is
ct of continual dispute, dates, line of march, names
Pharaohs, place of the House of Bondage whence
ws swarmed out. The only safe view to take is
he problem is insoluble, and that its resolution
be tied up with the sheaf of paradoxes collected
Morgan. Mr. Villiers Stuart found the cultivation
ar prosperous, by means, though, of that apology for
y "forced labour," and he is indignant at the
ngs of the unhappy fellaheen, as also at the urgent
e of taxation and the system of baksheesh and
l bribery which pervades the modern as extensively
did the ancient land of bondage; but *corvées*, it
rs, are necessary for the payment of Daira bonds,
the drachm," as in the Roman times, must be wrung
the hard hands of peasants. While however glancing
modern state of Egypt the interest of the writer is
ntrated on the Egypt of the past, Pharaohs, their
s and their princesses, and a fair popular account is
of Thebes. His weakness is a love of dabbling in
ology, and venturing out of his depth on general ques-
of comparative philology. Although, for example, an
ional word may resemble its Greek or Latin equiva-
the construction of the hieroglyphic or old Egyptian
the Coptic is totally different from those two classical
ues, the Egyptian having a closer resemblance to the
itic than the Aryan or Indo-Germanic languages.
o the Etruscan, the few known facts about its con-
ction point to the Turanian or Tartaric family rather
the Egyptian. The origin of the Egyptians is still
lved in obscurity, and belongs to the province of
ectural ethnology. More Caucasian in the north
at the earliest period, more Nigritic on the south and
later epoch, the Egyptians seem historically a mixed
, a fusion of conterminous races of Northern Africa,
Eastern foreigners, and Nigritic blood. The oldest
bitants still remain a mystery. One theory is that the
ptian was the primitive man of a vast continent, the
representative being the aboriginal Australian.
ongst other interesting points are visits to the Der-
es, especially the fortune-tellers, and a description of
ride of the Sheikh of the Saidieh over the bodies of
ng men, who must have suggested to the apostle, had
seen him, the subject of Death on the Pale Horse.
e the car of Juggernaut, the Sheikh of the Saidieh is
d to have been abolished. The ceremony might have
n the relic of an old Egyptian one, and Pharaoh riding
r his prostrate enemies may have anticipated the
ik of the Saidieh. Altogether the work is entertaining
d amusing; it is not so dry as a guide or handbook,
r so learned as an Egyptological history such as that of
rugsch-Bey, nor so elaborate as Wilkinson's Manners
d Customs, and Topography, or other travels by pro-
ssed Egyptologists; but its style is light and sparkling,
d the principal details of history, mythology, and archæo-
gy have been fairly mastered. In the minute details of
ilology it is weak, but they do not affect the general
ader, and are easily set right *en passant* by the expert.
hey will do no harm to scientific research, and they will
ause and to some extent instruct the public. The plates
are also fairly done, and their colouring renders them more
than usually attractive. It is decidedly agreeable to while
away the monotony of a voyage down the river of the
desert, as the Nile may be justly styled, and to those
whose only travels are round their room, it will convey
some pleasing impressions of what a visit to Egypt might
show them.

LETTERS TO THE EDITOR

[*The Editor does not hold himself responsible for opinions expressed by his correspondents. Neither can he undertake to return, or to correspond with the writers of, rejected manuscripts. No notice is taken of anonymous communications.*

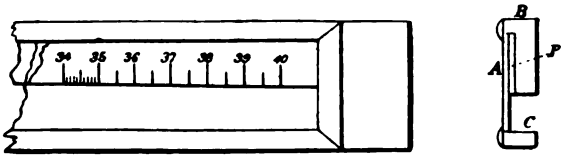
[*The Editor urgently requests correspondents to keep their letters as short as possible. The pressure on his space is so great that it is impossible otherwise to ensure the appearance even of communications containing interesting and novel facts.*]

Improved Arrangement of Scale for Reflecting Instruments

THE inconvenience resulting from the position of the scale in the ordinary well-known form of Thomson's reflecting galvanometer must have been experienced by all who have had occasion to use it much, and especially by myoptic individuals. This I have been able to eliminate very easily, as hereafter described, so that there is no further craning over to see "the spot," or getting in one's "light" in so doing.

The scale is mounted as shown in the sketch, which gives a front view of one end of the scale and a cross-section of the same.

B is a wooden scale-board with longitudinal slot, as shown at C; P is the paper scale, cut so that all the division lines reach the inferior edge; A is a slip of plane glass, finely ground as to its lower half on the side towards C, from one end of the slip to the other; the scale is so placed that the lower end of the division lines just touches the ground part of the glass slip. The image of the slit with a fine wire stretched across it is focussed in the ordinary manner on the ground part of the glass, and will of course be clearly seen by the observer on the opposite side of the scale; as the line and printed divisions are in the same plane, there is no parallax; and a great increase in accuracy of



reading the position of the hair line is obtained, owing to the greater ease of observing that two lines coincide when end on to one another than when superimposed; and further, from the circumstance that the room need not be darkened.

This arrangement has been introduced at the beginning of this year by me in the testing-room of Messrs. Siemens Brothers and Co. at Woolwich, and has been most readily accepted by all my assistants, and I venture to say that any who adopt this arrangement will never return to the previous form.

I may state that I place the lamp and its slit on one side and reflect the beam of light on to the galvanometer by a mirror or total reflection prism, and further by means of two long plane mirrors reduce the actual distance between the galvanometer and scale, so as to have everything close to the observer's hand. The scale I have adopted is divided into half millimetres, and it is perfectly easy to read to a quarter of a division, and with a hand magnifying-glass still further.

This method is of course applicable to any physical instruments which are read by a reflected spot, and as there are no "patent rights" it is placed at the disposal of all.

Charlton F. JACOB

A Note on Flame-Length

THREE years ago, whilst endeavouring to make use of flame-length as a means of testing the economic values of different qualities of coal-gas by the determination of their specific flame-

lengths, I was led to the discovery of some simple relations, the further study of which will perhaps one day help to simplify the theory of flames. By specific flame-length I mean the length of flame of a combustible gas burning in a normal atmosphere at a standard rate through a simple circular orifice under such conditions as to produce a symmetrical, vertical, steady flame capable of being measured. These conditions are not difficult to obtain in the case of coal gas. In fact for a very long time a flame-length test has been in use amongst gas-makers, but as the comparison has not always been made on the basis of volume the results have not always been satisfactory. The system I advocated was that of stating the flame-length for some standard rate. It occurred to me at that time that the flame-length should be proportional to the consumption or rate of issue of the gas. On submitting this theory to experiment I obtained satisfactory evidence that such was the case, as the following table taken at chance from a series of experiments will show:—

Flame-length. Inches.	Rate of consumption per hour. Cubic feet.	Calculated rate for 10″ flame. Cubic feet.
2	·75	3·75
3	1·13	3·77
4	1·5	3·75
5	1·85	3·70
6	2·25	3·75
7	2·6	3·71
8	2·98	3·72

I have therefore formulated the following laws:—

1. That the flame-length of a combustible gas is proportional to the consumption.

2. That the flame-length is the distance travelled by a gas in obtaining oxygen for its consumption.

3. That the flame-lengths of different gases are proportional to the relative amounts of oxygen required for their combustion.

The last remains to be proved, and I have been led to experiment upon simple gases such as hydrogen, carbonic oxide, and sulphuretted hydrogen, with the object of determining their specific flame-lengths; but these gases give flames offering great difficulties in measurement. The flames given by coal-gas under suitable and easily-obtained conditions offer no difficulty, but I have not been able at present (owing to the difficulty mentioned above) to obtain very satisfactory results with the above-mentioned three simple gases. Other simple gases have suggested themselves, but the cost of preparing them in a state of purity in sufficient quantity has at present prevented their use. However, with regard to sulphuretted hydrogen and carbonic oxide, I have found their flame-lengths stand in the relation of 3·2 to 1.

In view of the difficulty of measuring the flames of these simple gases I am about to effect the determination by indirect means. By preparing mixtures of known composition that will give easily-measurable flames, I hope to be able to throw some light upon this subject of flame-lengths.

March 22 LEWIS T. WRIGHT

Future Development of Electrical Appliances

As many of your readers have doubtless read Prof. Perry's interesting paper on the future development of electrical appliances, a remark on one or two points might not be out of place. In speaking of the application of electricity to railway travelling, Prof. Perry says that the weight of the train would be much reduced under the proposed conditions, and rail friction would be minimised. It strikes us that to have light trains would not be altogether an advantage, for several reasons. The lighter the train the less profitable would be the *vis viva* against a strong wind (and the latter is an important element in railway locomotion). Again, the stability of a heavy carriage is much greater than that of a light one, and a heavy engine in front of the train must steady the whole system. It would be interesting to ascertain from a practical engineer whether a train of six coaches with self-propelling powers could safely run at a speed of fifty-eight miles an hour. GEORGE RAYLEIGH VICARS

Woodville House, Rugby

Prehistoric Europe

I AM sorry to have to ask you again to allow me to correct some statements made by Prof. Dawkins in the matter of the Victoria Cave explorations (NATURE, vol. xxiii. p. 482).

1. He says that "the antiquity of man in the Vict... solely due to the *perfervidum ingenium* of Mr. Tiddi... was first based on a fragment of fibula which ultimat... out to belong to a bear. Then it was shifted to the ... small bones." It is not, I believe, usual in the ... over your own broken disabled weapon to your ... defend himself with when you take a new one. ... appears to be one of Prof. Dawkins's tactics. Wh... the above remark, would believe that Prof. Dawkins ... the following opinion? "Although the fragment [of ... is very small, its comparison with the abnormal ... Prof. Busk's possession removes all doubt from my ... its having belonged to a man who was contemporary ... cave-hyena and the other Pleistocene animals found in ... ("Cave-Hunting," p. 120.)

So far from the evidence having been "shifted" ... small bones, on the breaking down of the fibula ... latter event happened in 1878, whereas attention was ... the former in the Reports for 1875-6, the respective ... their discovery.

2. "The bones are recent," says Prof. Dawkins. ... evidently a very old bone," said Prof. Busk, after inspe... experimenting on one of them submitted to him; and ... of the circumstances of its discovery confirm that opinion.

3. "The cuts have been probably made by a me... That is a mere opinion, and to show what it is ... remark that at the discussion at the Anthropological In... 1877, when Prof. Dawkins stated that the marks ... they had been made with a Sheffield whittle, another ... at least equally distinguished, and apparently equall... to oppose the evidence, said that the marks seemed to ... made by a rock slipping across the bones.

4. Prof. Dawkins states that there were frequent ... materials after I took charge of the work. He has ... misinformed, for his own visits to the Cave during ... were not sufficiently frequent to warrant any such ... and our endeavour was to work the Cave in such a ... would entirely prevent the possibility of such accident ... mixture of the remains.

5. Prof. Dawkins goes on to show:—(1) Either ... Geikie and I believe that "there is evidence of inter... pre-glacial man, possessed of domestic animals, and ... using edged tools of metals" (which we certainly d... that (2) in his opinion goat has never existed anywhere ... a domesticated animal, for his remarks proceed upon ... other of these two assumptions.

6. Bones of goat were far from uncommon in the ... of the Cave, and found under such circumstances as ... render their slipping down from higher beds out ... possible. The same is the experience of that distin... explorer, M. E. Dupont, Director of the Geological Sur... Belgium, in the caves of that country:—"J'en maintiens ... ment la co-existence avec ces espèces perdues" (*Journ. Anth. Inst.*, vol. vii. No. 2, p. 168). Unfortunately the ... of goats in Pleistocene deposits in Great Britain has ... elevated to a dogma, and when the animals are found ... association it is immediately assumed that they have ... from above—a confession to a very slipshod method of ... —or, that the beds have previously been disturbed. All ... cases should be most carefully inquired into and observed ... time without prejudice.

7. Again, Prof. Dawkins says that I wrote that the fact ... finding of reindeer with the earlier Pleistocene animals ... "noteworthy," and that it is now too late to recall it. I ... recall my statement, but I should like it quoted ... "Your reporter had an impression that the reindeer ... occurred at some height above the hyena-bed.[1] Be ... may, Prof. Dawkins's opinion[2] is entitled to great weight ... is indeed the view generally held. At the same time, ... ing that hyena and reindeer are not uncommonly found ... in caves, when, as in this case, we see them mixed ... one or both ends of a section, but separated through ... of seventy feet in length by a thickness of deposits ... regard the fact as at least an interesting one, and, when ... noteworthy" (Brit. Assoc. Reports, 1876, p. 118). ... Dawkins shall have the whole of that. I will not ... the middle sentence. R. H. Tiddeman

Hastings, March 26

[2] ... of the co-existence ...

Induction Current from Leyden-jar Discharge

WAS led to try the following simple experiments with the ent induced from Leyden jar discharge, from the knowledge hat is the case in the Ruhmkorf's coil induced currents.

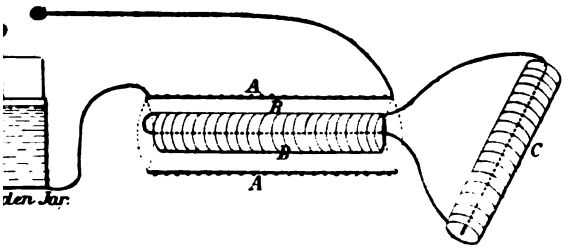
have since found the experiments have often been tried re; but all may not be aware how simply and easily the lts are shown.

fter trying flat coils I found it more convenient to coil stout lated wire round glass tubes. A few yards of stout wire id a tube A one foot long and 1¼ inches diameter gave me primary coil; a similar tube B of less diameter to put de A formed my secondary; and a third coil C enabled me to mine the current induced in B, with respect to its magnetising ver, at a distance, away from the influence of the primary A.

electrical machine, a Leyden jar or two, a number of un-gnetised knitting-needles marked with paper at one end, and ompass-needle to test polarity, are also required.

The experiments are as follows :—

(1) With coil A alone show that a needle is magnetised accord- to Ampère's law; if we regard the direction of current to from the + coat of the jar to the − coat.



(2) Now arrange the coils as shown, A as primary, B as condary, C in the circuit of B, and a needle in C. Let there be break in the circuit of B and C.

Then the magnetism induced in knitting-needle shows by (1) an tion as of a current *inverse* to that in A.

(3) Now interpose a break in circuit of B and C, so that induced rrent gives a spark. We now get the needle oppositely mag-etised, showing a direct induced current; and the magnetisation *far stronger* than in (2).

This points to the two opposite induced currents both passing hen there is no air-break; and the inverse having the strongest agnetising action; but the result weak. An air-break stops ie inverse current, and the far greater effect of the direct rrent un-neutralised by the inverse is very marked; it can asily be shown to a class, for example.

I may add that I have been unable to try what results one ets with galvanometers from lack of instruments.

Cheltenham W. LARDEN

Classification of the Indo-Chinese and Oceanic Races

IT is surprising that Mr. Murton should have had any difficulty bout the characters used by me to indicate the word *Paptwah*. he form in question is identical with his own, the apparent ifference being due to the two different characters respectively mployed by us to express the labial *p*. In the Arabic alphabet here is no sign for this letter, because the sound does not occur n the Arabic phonetic system. Hence other Muhammadan nations using the Arabic alphabet supply the missing letter in various ways, the Persians, Afghans, and Indians by the form ب, the Malays usually by ڤ. Hence the two apparently different but really identical forms پتوه and فتوه which have puzzled Mr. Murton and his Malays of Singapore.

A. H. KEANE.

Crabs and Actinia

THE account of the actinia on the claws of a crab in your last number (p. 515) is of interest as raising the point as to what benefit the crab derives from its friends. In the *Annals of Natural History*, many years ago, I wrote that, having for a long period kept *Adamsia palliata* with *P. Prideauxii* in confinement, I had no doubt but that the white tentacles of the anemone were a bait which attracted various small animals within reach of the crab's claws, though it did not, as Möbius seems to think, in any way aid the crab in capturing its prey.

In the South Sea Islands I saw a splendid specimen of a crab carrying a large actinia. The habit of the crab was to conceal itself entirely in the sand, leaving the actinia waving its tentacles on the surface. No sooner however did a small crab, annelid, or other creature come within reach than the crab, shooting its claw out of its concealment in the sand, struck out, and in most cases captured it. Here there was no doubt of the use of the actinia as a decoy.

H. STUART WORTLEY

Patent Office Museum, South Kensington, W, April 4

Migration of the Wagtail

WITH reference to the statement of Herr Adolf Ebeling (*apud* the correspondence from the New York *Evening Post*, quoted in your issue of February 24, vol. xxiii. p. 387), that the fact that wagtails in their wintering "came to Africa, and especially to Nubia and Abysssinia, was then unknown to us," permit the remark that as "*then*" must refer to a date not earlier than 1850 (when Heuglin went to Egypt), the appearance of wagtails on the west coast of Africa, as far south as Cape Verd, had been observed more than half a century before.

In the *Annales de Chimie* for July, 1793, M. Prélong, one of the lieutenants of Stanislas, Chevalier de Boufflers, and director of the hospital at Gorée, records the arrival on September 14, 1788, of a flight of *bergeronnettes* from the north. In connection with this M. Prélong remembered that Adanson had seen swallows at Senegal October 9, 1750 (?), while he himself could testify to their leaving his native *pays* (the Hantes-Alpes) towards the end of September. Prélong took ship for home in the middle of May, 1789, and was accompanied by his feathered friends the wagtails.

N. J.

New York, March 15

Sound of the Aurora

UPON this subject it may not be out of place to recall the fact that the passage of large meteors is not uncommonly described as accompanied by a hissing sound. I have met with statements of this kind in the case of meteors which were proved to have been twenty, thirty, or forty miles distant from the observer, and the sound of which, therefore, if it had reached him at all, must have reached him after such an interval of time that he would have been very unlikely to connect the two phenomena. Moreover the sound described in these cases is of a totally different character from the true sound of meteors, which is spoken of by those who have heard it as a heavy roaring or rumbling sound.

The explanation of the alleged "hissing" is not difficult when we remember that the untrained observer of a bright meteor (although it may be distant fifty or a hundred miles from him) invariably regards it as a near object, falling, it may be, into the next field, or behind a neighbouring hill. Regarding it in this light, he attributes to it, by a well-known mental process, a sound such as a firework at the same distance might be expected to produce.

May not the "rustling" of the aurora be equally a subjective phenomenon?

GEORGE F. BURDER

Earthquake Warnings

IN *Comptes rendus*, lxxxi. October, 1875, I find it stated, on the authority of M. Rivet, Telegraph Superintendent at Fort de France, Martinique, that when that island was visited by repeated earthquake shocks in September, 1875, each shock was preceded by a very marked disturbance of the electric telegraph needles. M. Rivet suggested that in this way warnings otherwise unattainable of impending shocks might be obtained.

It would be interesting to learn whether this observation has been confirmed by recent experience on the Continent.

Such warnings might often be the means of averting loss of life and property, and in cases like that at Ischia would, by their occurrence or non-occurrence, afford some additional clue to the real nature of the forces at work.

H. M. C.

Charlton, March 31

ON THE EARTHQUAKES AT AGRAM IN 1880-81

[At our request Prof. Szabo, Professor of Geology and Mineralogy in the University of Budapest, has prepared for the pages of NATURE the following account of the recent earthquakes at Agram. This account is a thoroughly reliable one, as it is drawn up from information obtained from Dr. von Hantken, the Director of the Hungarian Geological Survey, and Mr. Schafarrik (Prof. Szabo's assistant), both of whom were officially deputed to visit the district and inquire into the whole of the facts.]

On November 9, 1880, at 7h. 33m. 53s., a very violent earthquake passed over the south-western quarter of Hungary and also Bosnia and Herzegovina. The limits of this large territory are approximately as follows:—West, the peninsula of Istria and the town of Trieste; north, Vienna and Gödöllö (north-east from Budapest); east, the flat lands between the Danube and the Theiss; and south it reached far beyond Serajewo, because the earthquake was felt in this town also very strongly. It is said by some that the earthquake was even observed in Budweis (in Bohemia) and in Debreczen (east-north-east from Budapest). This territory is approximately equal to a circle, the radius of which is forty geographical miles long, and therefore its area is nearly 5000 square miles. From all information received up to the present time it may be asserted that the earthquake was not equally felt over the whole territory, but mostly in the centre of the circle—in the environs of Agram, where the damage occasioned was considerable.

According to the testimony of trusty witnesses the earthquake began on the day mentioned above with a strong shock in an upward direction, which was accompanied simultaneously with a perceptible and loud subterranean noise; this was followed by a subsidence; then came a perpendicular shock from below; and lastly came an oscillatory movement of the earth in an east-south-east to west-north-west-direction. This movement, which lasted nearly ten seconds, was so intense that in the town of Agram not only all the larger public buildings, but with few exceptions every dwelling-house, was damaged more or less.

One peculiarity of this first shock is that not only were objects of small weight removed out of their original positions, and this was especially the case with objects standing on a flat surface, but it also produced a certain rotatory motion upon them (contrary to the hand of a watch); even some trustworthy witnesses affirm that the first shock had a rotatory effect on them.

Chimneys are the objects which are the most easily damaged by earthquakes, and so in Agram there was scarcely a chimney to be seen after the earthquake which had not been either cracked or entirely ruined. The number of fallen chimneys amounts to nearly a thousand. An enormous amount of damage was also done to the roofs of houses; one could see from the roof-tiles placed on laths that they had been shaken by the oscillation, and were partially broken and fallen down, especially those which were situated towards the east or west. All this happened in the morning when the streets were mostly crowded with people, and one must be astonished indeed that the great quantity of falling masonry, parts of walls, stone cornices, huge beams of wood, and pieces of broken glasses, &c., did not hurt more people; altogether only twelve were severely wounded (broken arms, hands, feet, head wounds, &c.), but only in two cases did the injuries prove fatal; about twenty suffered slight contusions. In the surrounding country three men died, and some suffered from various injuries.

Among the public buildings and the larger dwelling-houses in Agram not one has actually fallen to ruin, but the number of those houses, whose outward walls were obliged to be supported by long beams on every side, is considerable; much more terrible, however, is the [illegible] of destruction inside the buildings; the mortar from the walls of the rooms is for the greatest part fallen down, and the thinner walls have been shaken so much that some of them are totally fallen to ruin. Almost [illegible] buildings were so ruined by the earthquake that it is necessary to forbid their reconstruction, and the Senate of the town found itself compelled to order their demolition. Here is the corner house belonging to [illegible] Priester, with two storeys facing the Marie-Valerie Street and Jellacsics Square, whose western frontal wall separated itself from the other parts of the house, and entirely bent towards the Marie-Valerie Street; the house of Mrs. Zorgách in the Petrijani Street is ruined, must be demolished; the building of the Military Academy in Ujlak has been a real and sad ruin. In the upper part of the town the following edifices are designated to be demolished:—Br. Orsegovich's house, Mednyanszka Barracks, a certain part of the military "General-Commando" building, &c. The majority of those buildings which have been rendered uninhabitable by the earthquake is great, but with great difficulty using iron braces—they can be renewed. To these buildings belong the cathedral, which is erected in the [illegible] square courtyard of the archbishop's palace. In the cathedral the vault of the sanctuary has fallen in and covered the high altar and the space before it with [illegible] ments of wall and rubbish; further, a part of the just before the organ and a little to the right of the entrance has fallen down in the centre nave; in the nave a very heavy horizontally-placed buttress fell down, and broke through the tombs where a coffin of a canon was; besides these more damages the main wall was split in several parts. The archbishop's palace itself has been damaged to such extent that the archbishop and the canons were obliged to leave their apartments for a long time. In the manner the Franciscan and St. Mark's Churches are also damaged. One can also add among the others St. Catharine's Church, which has been sadly damaged, also the edifices of the University and of the "Reischule," and many other private houses. The chimneys of the gas-factory and of Grator's brick-yard were only partially damaged at the upper part.

After these come those houses which, though they very greatly damaged, yet the people were not obliged to quit them; and lastly follows the great number of buildings which sustained only smaller damages. For instance, little rifts near the windows or along the corners of the walls, through mortar, &c., falling down). The proportion between the number of the edifices which became uninhabitable and had to be demolished, in comparison with those which were slightly damaged, in a [illegible] degree and those which were damaged in a greater degree and those which were damaged in a greater degree, is 1 : 1 : 4. This arithmetical proportion nevertheless does not at all express the damage that happened, because among the two first categories are the most valuable buildings, viz. the churches, barracks, the largest and newest houses, while the mass of the third category consists of small low buildings; one must attend to the above descriptions because it is impossible to set exact bounds between the single categories, for there are many houses whose ground-floors were totally [illegible] chinks, the first- and second-floors already showed [illegible] ally more chinks in the walls, while the third-floor presented a terrible picture of destruction. The damage edifices caused by earthquakes depends on their situation, on their height, and on their solidity, they found that the weaker the walls were, where iron braces were not applied, the more were buildings damaged; as regards the height, on the occasion of this earthquake it was observed that the second floor was more damaged than the first, and the third more than the second; and finally as to the situa

are some remarkable examples, houses forming east and north-west corners were exceedingly ed, viz. south-east was the direction where the ock came from.

he environs of Agram the earthquake appeared with strength than in the town itself, but the damage surrounding country is not so general, because here peasants' cottages all built of wood. Here therefore e churches, the parsons' houses, schools, castles, ntlemen's private houses were the objects on which thquake left visible marks.

he buildings of any strength in the villages which ated at the south-east slope of the mountain called north from Agram, were damaged in a more or in legree; there is for instance the well-known place grimages, Remete (5 km. north of Agram), where lls of the church, which is ornamented inwardly ry beautiful frescoes, and of the steeple are strongly in all directions, while the vaulted roof of the nave lly fallen down; so is also the residence of the ; the damage caused in these two edifices amounts, ing to an official valuation, to 38,000 florins. In ina (7 km. north-east from Agram) the steeple, down in an easterly direction, broke through the d the vault of the church, so that now one can see e four very ruptured walls. On the other side of untain Sleme, in a certain part of Croatia named a, many castles were ruined.

circle, where the earthquake caused the heaviest has approximately the following bounds:—South-Karlstadt; west, Landstrass, Gurkfeld; north-north Rohitsch; north, Warasdin, Csáktornya; north-aproncza (Kopreinitz); east, Belovár; south-east, which corresponds to a territory of about 120 square the centre of this circle was the place where the first manated from. The data kept in the surrounding lative to the direction and the greatest intensity hock indicate the territory which lies to south-east gram, and forms the alluvium of the River Save starting-point of the whole phenomenon. Here vice in the earth appeared also, caused by the -oscillated motion. A little to the east from the of Resnik (east-south-east from Agram) was the cre- the alluvium of the Save. It was 5 kilometres long, l several interruptions, and extended in a south- ection, from which here and there some smaller radiated. This chief crevice, which continued the Save as far as the village of Scitarjevo, showed places a few days after the earthquake openings wo feet broad, but for the most part the crevice d with bluish alluvial sand, which was forced out, vith water by the opening and closing of the being formed by the oscillation of the soil, the rcing its way through this dense pulp, produced upheaval those small flat craters which many re inclined to declare volcanoes of mud. The n of these small craters is very variable; their rs differ between 2 and 75 c.m., their height 1 to and, calculating from these numbers the cubic s of the largest flat cone, we receive nearly 0·5 netres; this little quantity of the out-pressed l is enough to exclude the hypothesis that these ere the result "of a slow action for some hours." o-sulphuric gas was present during this pheno- as some believe, it is not known, because we want and trusty evidence on this point. Moreover it npossible that there should be an appearance of uantities of hydrosulphuric gas dissolved in the an alluvial slimy soil, because such water gener- tains decaying substances and finely-dispersed s, but one can in no case suppose that a great f hydrosulphuric gas would have produced the d ejected the sand mixed with water.

[redacted] ritory of 120 square miles the earthquake was felt with a gradually diminishing strength, and in many places the motion was so weak that a great many of the inhabitants did not remark it. Among these can be mentioned Fiume, where they felt only a very slight shock; then Budapest and Vienna, where only one or two became attentive to this phenomenon.

Beyond the territory of 120 square miles, where they suffered the strongest shocks, there are yet some environs, though far enough from the centre, where destruction also happened, for instance in Styria, and in Hungary, in the neighbourhood of Pécs (Fünfkirchen). To explain the connection of these cases with the entire phenomenon deeper researches must be made.

It remains to communicate shortly the statics of the earthquake.

1. November 9, at 7h. 33m. 53s. in the morning, the first shock enduring 10 seconds with a subterranean noise. This one has caused all the damage.

2. November 9, at 7h. 37m. in the morning: an oscillatory motion without a noise.

3. November 9, at 8h. 27m. 55s. in the morning: slight motion.

4. November 9, at 10h. 50m. in the evening: very slight motion.

5. November 10, at 6h. in the morning: very slight motion.

6. November 11, at 11h. 26m. in the forenoon: a strong oscillation, which effected some damage.

7. November 16, at 12h. 4m. in the morning: a sufficiently strong shock accompanied with a dull noise.

8. November 16, at 12h. 44m.
9. " " 12h. 49m.
10. " " 1h. 9m.
11. " " 4h. 24m.

} in the morning:

weak oscillations, of which only the last had a little more strength than the others.

So it lasted continually during December. Even in this year (1881) in January and February feeble shocks recurred after longer interruptions; the last shock was recorded in the newspapers from March 4

Budapest, March 18

THE ST. PETERSBURG DYNAMITE MINE

THE following account of the mine recently discovered in St. Petersburg, extracted from Russian sources, gives a remarkable picture of the state of society in the empire, where able chemists and expert miners can be found to engage in such desperate undertakings.

It appears from a sketch-plan which accompanied the translation put into our hands, that the mine extended from one side of Malaya Sadobaya Street to the centre of the roadway; the total length of the mine gallery being fifteen paces, the street must be thirty paces, say seventy-five feet wide.

The gallery terminated in a chamber about double its diameter, and in this was found the charge contained in a case twenty-two inches long and eight inches diameter, weighing sixty-five pounds, and beside this a glass jar contained about thirty pounds more of the explosive substance, apparently an excess quantity over that required for the actual explosion. The explosive consisted of a species of dynamite made by mixing nitro-glycerine with powdered charcoal. This is more powerful in its effects than the ordinary substance, in which an inert body, generally a soft infusorial earth, takes the place of the charcoal. The description of the fuse, as contained in the Russian account, is very obscure, but so far as can be made out it would appear to have consisted of a wide heavy glass tube containing an explosive, described some time back in NATURE, and prepared by mixing nitro-glycerine with about 10 per cent. of gun-cotton, the result being a very explosive substance of a partially gelatinous character. In the midst of this, and

surrounded by a mixture of potassic chlorate and antimonious sulphide, was a sealed glass tube containing concentrated sulphuric acid and a leaden weight. The whole was then apparently connected with the dynamite in the case by means of an india-rubber tube also containing explosives. If this was the actual construction the *modus operandi* of the conspirators was very simple, for the heavy glass tube had only to be allowed to fall, when the lead would have broken the sulphuric acid tube, and the chlorate mixture would have at once inflamed, and the explosion of the jelly would have communicated by means of the rubber tube with the torpedo. At the same time it is very difficult to imagine the reasons which could have induced the conspirators to adopt so crude a method when, as it appears from the account, they had at their disposal in the room adjoining that from which the mine was driven no less than four galvanic batteries, with which the explosion could have easily been instantaneously effected by those on the watch for the passage of the intended victims, a method of operation much more consonant with the skilled character of the other parts of the work. It is however very difficult to understand a description such as this when derived from a non-scientific source, as may be imagined when one of our daily contemporaries stated that the fuse contained "*bartholley salts*," and another "chlorate of potash and *sulphide of ammonium*."

Whatever may have been the real mode intended to have been used by the conspirators, the results would have been sufficiently frightful, as it is probable that the charge found would have made a "crater" of about fifty feet in diameter.

The jelly contained in the glass tube was, when analysed, found to contain about 4 per cent. of camphor. This was added to render the mass less sensitive to any accidental shock which it might incur, and is an ingenious application of principles laid down by Abel (*Proc.* Roy. Soc. xxii. p. 163) in his well-known paper on "The History of Explosive Compounds," in which, though not actually mentioning the dilution of a liquid or semi-liquid explosive by the solution in it of another body, he clearly indicates the probable effects of such a treatment. That men of education and ability should so apply their undoubted powers must be a matter of regret to every student of science.

FISH-CULTURE IN THE UNITED STATES

IT is a common saying that everything in America is on a larger scale than in this country. The longest rivers, the largest lakes, the highest mountains, the broadest plains, the most stupendous waterfalls, and the biggest hotels, are all to be found in the New World. Fortunes are made with a rapidity which is unparalleled in Europe; and men who only lately were penniless adventurers are losing or winning millions in New York. The latest example of the scale on which everything in America is conducted may be found in a volume of more than 1000 pages, printed in the Government printing-office, bound in the Government "bindery" of the United States, and containing the Annual Report of the United States Commission on Fish and Fisheries. The volume, it may be added, has been preceded by five others of almost equal length; and gives a remarkable idea of the importance which the Americans attach to fish-culture.

It would obviously be impossible to attempt, within the compass of a newspaper article, any adequate review of a work of this character. But we may perhaps indicate its nature by rapidly describing its contents. The volume, then, is roughly divisible into two parts. The first 64 pages contain the Report of the Commission; the last 988 pages are occupied with appendices and an index. Forty-four appendices of unequal importance are thus published. The greater portion of them consists of translations or reproductions of papers published in other countries and having more or less reference to the work of the Commission. For instance, there is a report by Herr Wallem (the well-known Norwegian Inspector of Fisheries) on the American Fisheries; by Prof. G. O. Sars on the Norwegian Deep-sea Expedition of 1878; by Dr. Stirling of Edinburgh on the Recent Outbreak of Salmon Disease; and by other authorities on various subjects. In addition the appendices contain [illegible] papers by Messrs. Livingston Stone, C. G. Atkins, and other American fish-culturists on matters more or less connected with fish-culture in the United States. The volume undoubtedly contains a vast mass of information. Much of it indeed is written in a style which in this country would be considered more suitable to a private view than to an official report. But the American point of view of government is so different from our own that the Englishman cannot easily form an impartial opinion on this point.

Herr Wallem estimates the yearly profit, by which I think he means the gross yield, of the fisheries of the United States at 27,300,000 dollars. In this are "naturally not included what foreign nations capture on the banks of America, nor what the fisheries of Canada yield. If one should take both these factors into calculation the amount mentioned may perhaps be increased by one half, because the French fisheries on the Newfoundland Islands have a yearly produce of \$1,365,000 to \$1,638,000, and the Canadian fisheries yield \$10,920,000 to \$12,285,000 yearly." Herr Wallem adds in a note that "for comparison it may perhaps be instructive to state that the Norwegian Marine Fisheries may be estimated at \$12,285,000 to \$13,650,000 yearly, and the French at \$15,015,000 to \$16,380,000." If these figures may be accepted as correct on the high authority of Herr Wallem, the American fisheries must be worth about 5,500,000*l.* a year; the French fisheries 3,000,000*l.*; the Norwegian fisheries 2,600,000*l.*; and the Canadian fisheries 2,250,000*l.* We have unfortunately no statistics at our command which would enable us to compare these values with the produce of our own fisheries, but we do not believe that any competent authority would place their value at less than 6,300,000*l.* We believe that most persons would be disposed to name a higher sum. Englishmen, therefore, may feel the satisfaction of reflecting that the fisheries of the British Islands are still the most important in the world, though the fishermen of the United States are fast overtaking British fishermen.

Those persons who are most familiar with the British fisheries are aware that for years past complaints have been made of the injury done both to fish and fishing by the operations of trawling. It is very singular that trawling is also objected to in the United States. The Commissioners print in their appendices a paper from the fishermen of Block Island on the subject. From the similarity between the complaints disappointed examination. A trawl in England is a large net, attached to a heavy beam raised upon trawl or irons at either end, and dragged along the bottom of the sea. A trawl in Scotland is simply a draft net; a trawl in America is a long line baited with and left on the bottom of the sea. It is very odd these three distinct modes of fishing are all objected in the different countries in which they are employed. In Scotland the drift-net fishermen object to the trawl seine-nets; in England the drift-net fishermen object to the line fishermen object to the beam trawls. In America the hand-line fishermen object to the set-line fishermen whom they call trawlers. Among the fishermen of three countries there is a cry against trawling, and fishermen of the three countries are all alluding to distinct modes of fishing. These complaints may, of

, puzzle some antiquarians, who may naturally ıe that these races, speaking the same language, the same thing by the same word. They all are ɔ the jealousy usually felt by the introduction of new inery in any industry. The set-line fishermen, who lain of the beam trawls in this country, form the ɔlass which the hand-line fishermen complain of in ica under the name of trawlers; and the Govern- ; of both countries may safely disregard both laints, since one of them is the most effective answer · other.

· have reserved for the close of this article all refer- ːo what the Commissioners would consider the most ·tant portion of their Report. The Americans are the ɔst fish-breeders in the world, and fish-breeding is ıcted in the United States at a cost and to an extent ich in this country we can have little idea. According ː Report, the Commissioners distributed in 1878 no less 15,700,000 shad and 4,460,000 Californian salmon, es other fish. Such prodigious efforts will excite ise among persons who are acquainted with the diffi- s of obtaining even a few thousand ripe salmon eggs, ve naturally turn for information as to the results ı have ensued from such unprecedented efforts. Here ver we find, as it seems to us, the least satisfactory ɔn of the Report. The Commissioners claim indeed ıo less than 500 salmon were taken in the mouth of the ecticut River in 1878, a river which they imply had ew or no salmon in it for many years. It is possible fore that the Commissioners' efforts may have been .ssful in restocking that river with salmon; though we ːhat we should feel more certain of this if the fish ɔeen taken in the river itself, and not in the mouth But when they go on to infer that they may increase ·ield of shad, and even of herring and of cod, we with admiration of their energy, but without being ːnced by their reasoning. In this country, at any the best observers are satisfied that cod, herring, and · fish are annually bred in numbers compared with ˈı the fifteen millions of fry of the United States ːmission would represent an insignificant fraction, hat the destruction which is going on among them ıtural causes is so vast that even the capture of white by the ton-load makes no appreciable addition to it. arguments which Malthus, at the commencement of ·entury, used to illustrate the principles of population hought in this country to be strictly applicable to fish. fish, like all other animals, are undoubtedly increasing ·eater proportion than their food; and it is obvious efore that unless man can increase their food it is lost labour to increase their number.

ˈe have thus reviewed, at some length, a few of the ing facts in this long and interesting Report. With y of the conclusions in it we are unable to agree; but ːannot part from it without expressing a feeling of ɔst envy at the elaborate pains which the Government he United States is taking to understand the best hods of developing the great industries of their seas. his country we do not even take steps to obtain the statistical information on the subject. Might we in such a matter with advantage follow the example ·ur Transatlantic kinsmen?

THE PARIS OBSERVATORY[1]

BOUT two years ago Rear-Admiral Mouchez, director · of the Paris Observatory, resolved to bring together exhibition the instruments scattered in various parts, by joining to that collection the portraits of great onomers and methodically grouping all the documents ting ɔ the history of astronomy which could be pro- ·quest or otherwise, to lay the basis of a special museum of very great interest. This proposal, having received the approval of the Minister of Public Instruction, is now being realised. One of the large rooms on the first floor of the Observatory has already been fitted up and occupied, and through the kindness of Admiral Mouchez, who himself did us the honour of giving full details of his new collection, we are able to publish the description.

The first hall of the Astronomical Museum is very artistically decorated. It is circular in form, and well lighted by several windows. The ceiling will probably be adorned by a painting representing the transit of Venus over the Sun. There are nine paintings in the room, representing Louis XIV., founder of the Observatory, and directors and eminent astronomers who have

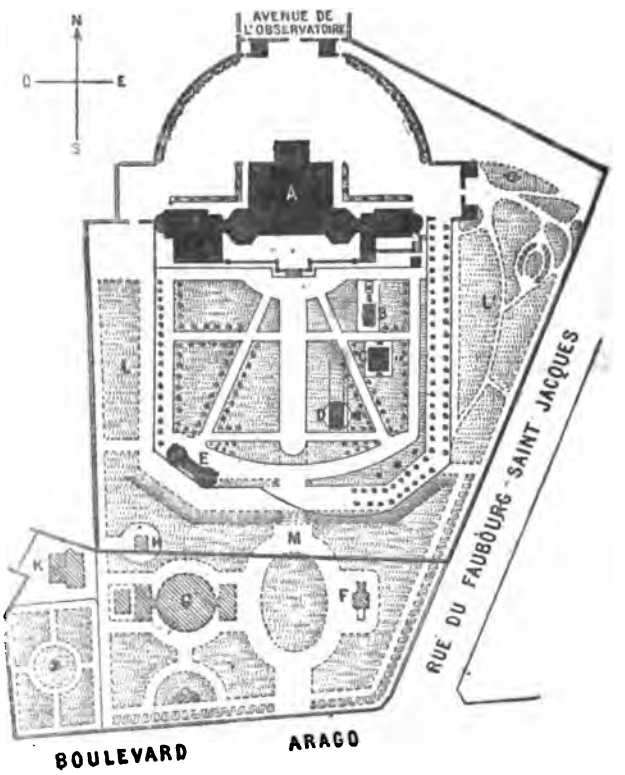


FIG. 1.—Plan of the Observatory, with the proposed extension on the south side to the Boulevard Arago. Present state: A, the Observatory; B, the "sidérostat," C, the meridian circle; D, the great telescope; E, equatorials; M, ditch to be filled up; L L, ditches. Ground to be annexed; F, the Bischoffsheim equatorial; G, the great refractor of 0·74m. aperture; H, Fortin's circle; K, the astronomers' dwelling-house.

succeeded each other to the present day: Cassini, Lalande, Delambre, Laplace, Bouvard, Arago, Delaunay, and Leverrier; the latter painted after death by Giacomotti, is the gift of M. Bischoffsheim. In the embrasures of the windows are displayed astronomical paintings representing groups of nebulæ, Saturn's rings, lunar volcanoes, clusters of stars, the remarkable drawings of Jupiter and Mars executed by MM. Henry, &c.

On the oak mantelpiece stands a magnificent Louis-Quatorze clock made by Coypel and recently restored by M. Passerat, a specimen of art so unique that virtuosos would certainly attach a great value to it. Round the room are observed several globes mounted on marble and oak pillars, two being especially worthy of attention: the celestial sphere of Gerard Mercator (1551), and the terrestrial sphere of the same geographer (1541). On the latter globe may be seen figured a certain number of the great lakes of Central Africa already known and their

[1] ɛ by M. Gaston Tissandier in *La Nature*, and M. ·rt of 1880.

positions well indicated in the middle of the sixteenth century. These spheres, which constitute documents of great importance historically, were recently discovered at the Brussels library through a folio pamphlet bought in 1868, and have been reproduced with great accuracy, by M. Malou.

The objects exhibited are carefully classified in glass cases, so that they can be examined by the visitor without being touched. In the first case, which is set apart for optical instruments, is observed Fresnel's great lens; also some of the object-glasses made use of by Cassini, and other valuable objects presented to the Observatory by Mme. Laugier, such as the optical apparatus made use of by Arago; the photometer, prismatic mirrors, and the polarimeter, by means of which the great astron... enriched science with so many beautiful discoveries.

The second case contains objects relating to the ... of the "metric system," comprising a standard ... several curious specimens of foreign measures. ... other glass cases, arranged in a circle round the ... contain various astronomical instruments, among ... we may mention the apparatus made use of by M. ... to measure the velocity of rays of light, a large ... of Rigaud, another of Bruner, one of the first ... ever constructed; also several instruments of ... modern date, the first portable meridian circle ... Mouchez, Gambey's theodolite, &c.

The case in the centre of the room is ...

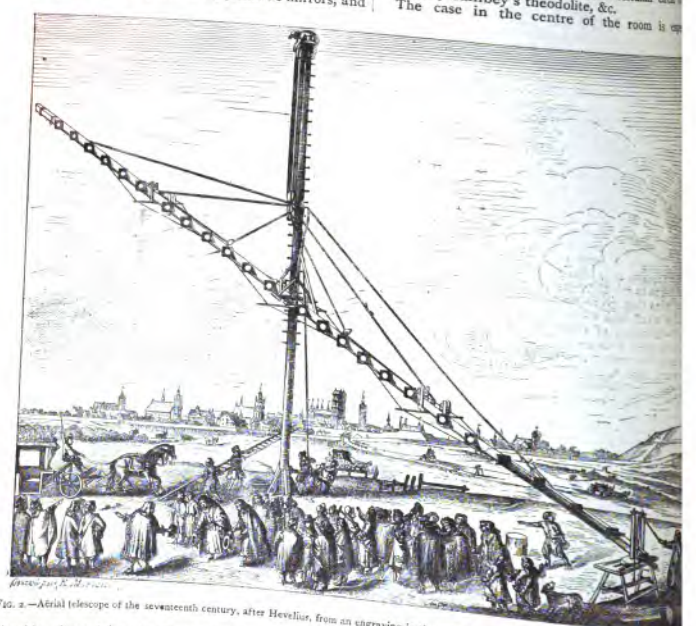

FIG. 2.—Aërial telescope of the seventeenth century, after Hevelius, from an engraving in the new Astronomical Museum of the Observatory ...

noticeable: it contains a curious collection of German instruments of the sixteenth century, in perfect preservation. The attention is at once attracted by several instruments of gilt brass, most artistically carved, which were made at Nüremberg in the sixteenth century. Amongst them we observed a curious mechanical arrangement for casting dice, which was probably used for some demonstration of the doctrine of probability and chances; a valuable sun-dial of carved brass, dated 1578, full of groups of allegorical personages; a species of altazimuth; a handsome repeating-circle, highly ornamented, and bearing the two-headed eagle of Germany; some astrolabes, quadrants, mariner's-compasses, a small ivory sun-dial of the sixteenth century, presented by M. Eichens. The history of all ... instruments except the last is unknown; but it ... posed that they were either presented to Louis ... are what is left from the spoil of the First ... having escaped the notice of the Allies in 1815.

On the lower part of this case are shown photo... of old engravings representing the astronomical ... ments of former ages. One of those curious pic... reproduced above (Fig. 2), showing the astron... telescope with a simple object-glass of long focus ... was constructed in the seventeenth century, and of ... an engraving was published by Hevelius. It may ... to convey an idea of the singular and gigantic instru... which astronomers of bygone times made use of.

floor above there is a special exhibi-
mber of photographs, which is being
d by new additions. They consist
all the ancient instruments copied
the period; and all the foreign instru-
e, taken from nature. There are also
ng the principal observatories in the

ıencement of the astronomical museum
ratory. It will be completed by organ-
cular room resembling that which we
passed under review. This new room

ACHILLE DELESSE

to h ve to record the death of this eminent
st, w hich took place, after a long illness, on
eles e was born at Metz, and was educated
n of that town, afterwards proceeding, at
enty, to the École Polytechnique at Paris.
ligen and successful student, and in 1839
ee as a mining engineer. He then travelled
me th rough his own country, in Germany,
l the British Islands, and in 1845 was ap-
fessor of Geology and Mineralogy at Besan-
he also practised as a mining engineer. It
his res idence here that he wrote his "Notice
aractères de l'Arkose dans les Vosges," and
oire sur la Constitution minéralogique et chi-
Roches de Vosges," both of which works
n 1847. After a stay of five years at Besançon

Delesse returned to Paris, where he was employed as a mining engineer, and was especially engaged in superintending the quarrying operations about the city for nearly eighteen years. In 1855 he prepared the report on building materials in connection with the Exposition Universelle of that year in Paris. In 1864 he was nominated Professor of Agriculture, Drainage, and Irrigation in the École des Mines. Delesse's earliest researches were directed to pure mineralogy, and he paid great attention to the subjects of pseudomorphs and the association of minerals, and this led him to study the question of the metamorphism of rocks. The outcome of this period of study was his well-known work, "Recherches sur l'Origine des Roches," published in 1865, in which he argued ably and forcibly in favour of the view that crystalline rocks owe many of their characters to the action of superheated water, and are not produced by simple dry fusion. This important work of Delesse has exercised a marked and very beneficial influence on the progress of petrographical science, and its originality and value were at once recognised by the most advanced thinkers of the time. Already in 1858 Delesse had published two of his valuable maps, namely, the "Carte géologique souterraine de la Ville de Paris" and the "Carte hydrologique de la Ville de Paris," and his subsequent studies came to be especially directed into the channels of inquiry which were associated with the professorship that he had created and so ably filled. In 1868 appeared his work on the Rainfall of France, and other memoirs treating of the agricultural bearings of geology were produced about the same period.

The war of 1870 caused an interruption in the scientific labours of Delesse, and we find him at this period superintending the construction of cartridges in the departments. But in 1878 he was appointed an Inspector-General of Mines, and the south-east of France was assigned to him as his district. During the last twenty years Delesse has issued, in conjunction with MM. Langel and de Lapparent, a series of annual volumes entitled "Revue de Géologie," a work of such value that we regret to hear that it is to be discontinued in the future. Delesse received many honours in recognition of his valuable labours. He was an officer of the Legion of Honour, and filled the post of President of the Geological Society of France. As long ago as 1859 he was elected a Foreign Member of our own Geological Society. He was also for two years President of the French Geological Society, and he occupied the chair during the International Congress of that Society in 1875. In 1879 Delesse was elected a Member of the Academy of Sciences. In Delesse France has lost one of her most distinguished and widely-known scientific men.

PROFESSOR HELMHOLTZ'S FARADAY LECTURE

ON Tuesday evening Prof. Helmholtz gave the Faraday Lecture of the Chemical Society at the Royal Institution. We have so recently (NATURE, vol. xv. p. 389) given a full account of the life and work of the eminent German worker in various departments of science, that it is unnecessary to go over the ground again. A very fair estimate of his position was given in a leading article in the *Times* of Saturday last; and we are glad to notice that the leading journal now is glad to draw attention to men of science whose work is deserving of public notice. The University of Cambridge did itself the honour of conferring upon Prof. Helmholtz the degree of LL.D. on Thursday last, on which occasion the public orator, Mr. Sandys, made the following elegant and appropriate speech :—

"Dignissime domine, domine Procancellarie, et tota Academia :

"Singularum quidem scientiarum terminos protulisse,

plurimis concessum est; uni vero plurimarum fines extendisse raro contigit. Atqui hodie virum salutamus, qui rerum naturae regionem plusquam unam feliciter occupavit, qui primum physiologiae penetralia perscrutatus, deinde physicorum studiorum campo amplissimo potitus, ipsam denique mathematicorum arcem fortiter expugnavit, ex alia deinceps in aliam provinciam progressus, velut militum Romanorum ille maximus, 'victrices aquilas alium laturus in orbem.'

"Militarium medicorum ordini adhuc adscriptus, argumentum magnum intra unius libelli fines artiores complexus, ostendit vim illam, quae nonnunquam viva vocatur, in universa rerum natura esse conservatam, partes eius aliam ex alia posse generari, summam esse immutabilem. Quid huius ingenio excogitatas commemorem quaestiones illas hydrodynamicas, quid vortices illos qui scientiae mathematicae ad interiora pertinent? Illa vero magna opera, quorum in uno sensus audiendi clarissime explicatur, in altero videndi sensus pulcherrime illustratur, omnes, nisi fallor, aut vidistis ipsi, aut fama certe audivistis. Pulcbrum est (uti hunc ipsum confitentem legimus), pulchrum profecto est, e scopulo quodam excelso late tumultuantem oceanum prospicere, fluctusque procul albescentes, modo breviores, modo longiores, oculis discernere: pulchrius autem in physiologiae templo intimo versatum, oculorum ipsorum structuram exquisitam introspicere, et, lucis legibus obscuris ordine lucido evolutis, fluctuantes luminis motus metiri variamque colorum venustatem explicare: omnium fortasse pulcherrimum, in iisdem arcanis morantem, undas illas aeris quas nulla nisi mentis acie contemplari possumus, inter sese audiendo distinguere; sonitus cuiusque, dum tremit vibratque, intervalla numerare; universam denique musices theoriam et mathematicis et physicis et physiologicis probavisse argumentis.

"Ille igitur qui tot provinciarum confinia lustravit, tot scientiarum fines propagavit, a nostra praesertim Academia, cuius alumni totiens ex eodem studiorum campo laureas reportarunt, ea qua par est reverentia hodie excipitur. Qui Academiae nostrae nemora, et iuventutis Academicae ludos et certamina iampridem admiratus est, idem fortasse severiora nostra studia quo melius noverit, eo benignius indies aestimabit. Vos certe, qui, talium virorum exemplar procul venerati, etiam nostras inter silvas verum quaeritis, quanquam hodie nemora illa nostra gravis umbra contristat, tamen inter ipsas lacrimas non sine gaudio virum magnum vidistis, quaque soletis benevolentia laudatum audivistis.

"Vobis igitur praesento Academiae Berolinensis Professorem illustrem, HERMANNUM LUDOVICUM FERDINANDUM HELMHOLTZ."

The Society of Telegraph Engineers are to give a *conversazione* in honour of the distinguished electrician at University College, Gower Street, on the evening of the 11th inst. The large library and entrance hall will be lit up by electric light, and it is hoped there will be a full display of all the recent novelties in electrical science.

As might have been expected, there was a distinguished audience on Tuesday evening to listen to Prof. Helmholtz at the Royal Institution. Prof. Roscoe, the President of the Chemical Society, in introducing the lecturer, made the following remarks:—

"Ladies and Gentlemen, Fellows of the Chemical Society—The cordial welcome which you have just given to Prof. Helmholtz shows me that he needs no formal introduction at my hands. His name is honoured wherever science is valued, and both his face and his voice are well remembered in this room. It may therefore suffice if I say that eminent as an anatomist, as a physiologist, as a physicist, and as a mathematician, we chemists are now about to claim him also as our own.

"Prof. Helmholtz, in the name of the Chemical Society, and on behalf of its Fellows here assembled, I beg to welcome you amongst us; I have the honour to you with the Faraday Medal of the Society request that you will favour us with your le which we shall all listen with pleasure and profit"

The Faraday Lecture[1]

THE majority of Faraday's own researches w nected, directly or indirectly, with questions r the nature of electricity, and his most import most renowned discoveries lay in this field. Th which he has found are universally known. I theless, the fundamental conceptions by which h has been led to these much-admired discoveries h been received with much consideration. His g aim was to express in his new conceptions as with the least possible use of hypothetical subst forces. This was really a progress in general m method, destined to purify science from the last re of metaphysics. Now that the mathematica tation of Faraday's conceptions regarding the na electric and magnetic force has been given Maxwell, we see how great a degree of exactne precision was really hidden behind his words w his contemporaries appeared so vague or obscure is astonishing in the highest degree to see what number of general theories, the methodical deci which requires the highest powers of mathematica he has found by a kind of intuition, with the c of instinct, without the help of a single mathem formula.

The electrical researches of Faraday, altho bracing a great number of apparently minute an nected questions, all of which he has treated w same careful attention and conscientiousness always aiming at two fundamental problems of philosophy, the one more regarding the nature forces, or of forces working at a distance; the the same way, regarding chemical forces, or those act from molecule to molecule, and the relation these and the first.

The great fundamental problem which Fara up anew for discussion was the existence of forc ing directly at a distance without any intervening m During the last and the beginning of the present the model after the likeness of which nearly all theories had been formed was the force of gr acting between the sun, the planets, and their sa It is known how, with much caution and even re Sir Isaac Newton himself proposed his grand hyp which was destined to become the first great posing example, illustrating the power of true method.

But then came Oerstedt's discovery of the ac magnets under the influence of electric currents force acting in these phenomena had a new a singular character. It seemed as if it would single isolated pole of a magnet in a circle arou wire conducting the current, on and on without end coming to rest. Faraday saw that a motion of th could not be produced by any force of attract repulsion, working from point to point. If the is able to increase the velocity of the magnet, the m must react on the current. So he made the experi and discovered induced currents; he traced the through all the various conditions under which ought to appear. He concluded that somewhere in of the space traversed by magnetic force there e peculiar state of tension, and that every change tension produces el rce. This ul hypothetical state h nally the elec nic state, and he s ns and po

[1] Ab

ing out what was this electrotonic state. He dis-ered at first, in 1838, the dielectric polarisation of tric insulators, subject to electric forces. Such bodies w, under the influence of electric forces, phenomena fectly analogous to those exhibited by soft iron under influence of the magnetic force. Eleven years later, 849, he was able to demonstrate that all ponderable ter is magnetised under the influence of sufficiently nse magnetic force, and at the same time he disco-ed the phenomena of diamagnetism, which indicated t even space, devoid of all ponderable matter, is gnetisable; and now with quite a wonderful sagacity l intellectual precision Faraday performed in his brain work of a great mathematician without using a single thematical formula. He saw with his mind's eye that these systems of tensions and pressures produced by dielectric and magnetic polarisation of space which rounds electrified bodies, magnets or wires conducting ctric currents, all the phenomena of electro-static, gnetic, electro-magnetic attraction, repulsion, and luction could be explained, without recurring at all to ces acting directly at a distance. This was the part his path where so few could follow him; perhaps a erk Maxwell, a second man of the same power and lependence of intellect, was necessary to reconstruct the normal methods of science the great building, the an of which Faraday had conceived in his mind and tempted to make visible to his contemporaries.

Nevertheless the adherents of direct action at a distance ave not yet ceased to search for solutions of the electro-agnetic problem. The present development of science, owever, shows, as I think, a state of things very favour-ble to the hope that Faraday's fundamental conceptions ay in the immediate future receive general assent. His eory, indeed, is the only existing one which is at the me time in perfect harmony with the facts observed, nd which at least does not lead into any contradiction gainst the general axioms of dynamics.

It is not at all necessary to accept any definite opinion bout the ultimate nature of the agent which we call lectricity.

Faraday himself avoided as much as he could giving ny affirmative assertion regarding this problem, although e did not conceal his disinclination to believe in the xistence of two opposite electric fluids.

For our own discussion of the electro-chemical pheno-nena, to which we shall turn now, I beg permission to se the language of the old dualistic theory, because e shall have to speak principally on relations of quantity.

I now turn to the second fundamental problem aimed at by Faraday, the connection between electric and chemical force. Already, before Faraday went to work, an elaborate electro-chemical theory had been established by the re-nowned Swedish chemist Berzelius, which formed the connecting-link of the great work of his life, the systema-tisation of the chemical knowledge of his time. His starting point was the series into which Volta had arranged the metals according to the electric tension which they exhibit after contact with each other. A fundamental point which Faraday's experiment contra-dicted was the supposition that the quantity of electricity collected in each atom was dependent on their mutual electro-chemical differences, which he considered as the cause of their apparently greater chemical affinity. But although the fundamental conceptions of Berzelius' theory have been forsaken, chemists have not ceased to speak of positive and negative constituents of a compound body. Nobody can overlook that such a contrast of qualities, as was expressed in Berzelius' theory, really exists, well-developed at the extremities, less evident in the middle terms of the series, playing an important part in all chemical actions, although often subordinated to other influences.

When Faraday began to study the phenomena of de-composition by the galvanic current, which of course were considered by Berzelius as one of the firmest sup-ports of his theory, he put a very simple question, the first question indeed which every chemist speculating about electrolysis ought to have answered. He asked, What is the quantity of electrolytic decomposition if the same quantity of electricity is sent through several elec-trolytic cells? By this investigation he discovered that most important law, generally known under his name, but called by him the law of definite electrolytic action.

Faraday concluded from his experiments that a definite quantity of electricity cannot pass a voltametric cell containing acidulated water between electrodes of plati-num without setting free at the negative electrode a corresponding definite amount of hydrogen, and at the positive electrode the equivalent quantity of oxygen, one atom of oxygen for every pair of atoms of hydrogen. If instead of hydrogen any other element capable of substi-tuting hydrogen is separated from the electrolyte, this is done also in a quantity exactly equivalent to the quantity of hydrogen which would have been evolved by the same electric current.

Since that time our experimental methods and our knowledge of the laws of electrical phenomena have made enormous progress, and a great many obstacles have now been removed which entangled every one of Faraday's steps and obliged him to fight with the con-fused ideas and ill-applied theoretical conceptions of some of his contemporaries. We need not hesitate to say that the more experimental methods were refined, the more the exactness and generality of Faraday's law was confirmed.

In the beginning Berzelius and the adherents of Volta's original theory of galvanism, based on the effects of metallic contact, raised many objections against Faraday's law. By the combination of Nobili's astatic pairs of magnetic needles with Schweigger's multiplicator, a coil of copper wire with numerous circumvolutions, galvano-meters became so delicate that the electro-chemical equivalent of the smaller currents they indicated was imperceptible for all chemical methods. With the newest galvanometers you can very well observe currents which would want to last a century before decomposing one milligram of water, the smallest quantity which is usually weighed on chemical balances. You see that if such a current lasts only some seconds or some minutes, there is not the slightest hope to discover its products of decomposition by chemical analysis. And even if it should last a long time the feeble quantities of hydrogen collected at the negative electrode can vanish, because they combine with the traces of atmospheric oxygen absorbed by the liquid. Under such conditions a feeble current may continue as long as you like without pro-ducing any visible trace of electrolysis, even not of galvanic polarisation, the appearance of which can be used as an indication of previous electrolysis. Galvanic polarisation, as you know, is an altered state of the metallic plates which have been used as electrodes during the decomposition of an electrolyte. Polarised electrodes, when connected by a galvanometer, give a current which they did not give before being polarised. By this current the plates are discharged again and returned to their original state of equality.

This depolarising current is indeed a most delicate means of discovering previous decomposition. I have really ascertained that under favourable conditions one can observe the polarisation produced during some seconds by a current which decomposes one milligram of water in a century.

Products of decomposition cannot appear at the elec-trodes without motions of the constituent molecules of the electrolyte throughout the whole length of the liquid. This subject has been studied very carefully and for a

great number of liquids, by Prof. Hittorff, of Münster, and Prof. G. Wiedemann, of Leipsic.

Prof. F. Kohlrausch, of Würzburg, has brought to light the very important fact that in diluted solutions of salts, including hydrates of acids and hydrates of caustic alkalis, every atom under the influence of currents of the same density moves on with its own peculiar velocity, independently of other atoms moving at the same time in the same or in opposite directions. The total amount of chemical motion in every section of the fluid is represented by the sum of the equivalents of the cation gone forwards and of the anion gone backwards, in the same way as in the dualistic theory of electricity, and the total amount of electricity flowing through a section of the conductor corresponds to the sum of positive electricity going forwards and negative electricity going backwards.

This established, Faraday's law tells us that through each section of an electrolytic conductor we have always equivalent electrical and chemical motion. The same definite quantity of either positive or negative electricity moves always with each univalent ion, or with every unit of affinity of a multivalent ion, and accompanies it during all its motions through the interior of the electrolytic fluid. This we may call the electric charge of the atom.

Now the most startling result, perhaps, of Faraday's law is this: If we accept the hypothesis that the elementary substances are composed of atoms we cannot avoid concluding that electricity also, positive as well as negative, is divided into definite elementary portions, which behave like atoms of electricity. As long as it moves about on the electrolytic liquid each atom remains united with its electric equivalent or equivalents. At the surface of the electrodes decomposition can take place if there is sufficient electromotive power, and then the atoms give off their electric charges and become electrically neutral.

Now arises the question, Are all these relations between electricity and chemical combination limited to that class of bodies which we know as electrolytes? In order to produce a current of sufficient strength to collect enough of the products of decomposition without producing too much heat in the electrolyte, the substance which we try to decompose ought not to have too much resistance against the current. But this resistance may be very great, and the motion of the ions may be very slow, so slow indeed that we should need to allow it to go on for hundreds of years before we should be able to collect even traces of the products of decomposition; nevertheless all the essential attributes of the process of electrolysis could subsist. If you connect an electrified conductor with one of the electrodes of a cell filled with oil of turpentine, the other with the earth, you will find that the electricity of the conductor is discharged unmistakably more rapidly through the oil of turpentine than if you take it away and fill the cell only with air.

Also in this case we may observe polarisation of the electrodes as a symptom of previous electrolysis. Another sign of electrolytic conduction is that liquids brought between two different metals produce an electromotive force. This is never done by metals of equal temperature, or other conductors which, like metals, let electricity pass without being decomposed.

The same effect is also observed even with a great many rigid bodies, although we have very few solid bodies which allow us to observe this electrolytic conduction with the galvanometer, and even these only at temperatures near to their melting-point. It is nearly impossible to shelter the quadrants of a delicate electrometer against being charged by the insulating bodies by which they are supported.

In all the cases which I have quoted one might suspect that traces of humidity absorbed by the substance or adhering to their surface were the electrolytes. I show you therefore this little Daniell's cell, in which the porous septum has been substituted by a thin stratum of [illegible]. Externally all is symmetrical at both poles; there is nothing in contact with the air but a closed surface of glass, through which two wires of platinum penetrate. The whole charges the electrometer exactly like Daniell's cell of very great resistance, and this it would not do if the septum of glass did not behave like the electrolyte. All these facts show that electrolytic conduction is not at all limited to solutions of acids or salts.

Hitherto we have studied the motions of positive matter as well as of electricity, going on in an electrolyte. Let us study now the forces which are able to produce these motions. It has always appeared somewhat startling to everybody who knows the mighty power of chemical forces, the enormous quantity of heat and mechanical work which they are able to produce, who compares with it the exceedingly small electric attraction which the poles of a battery of two Daniells show. Nevertheless this little apparatus is able to decompose water.

The quantity of electricity which can be conveyed by very small quantity of hydrogen, when measured by electrostatic forces, is exceedingly great. Faraday this, and has endeavoured in various ways to give least an approximate determination. The most powerful batteries of Leyden jars, discharged through a voltameter give scarcely any visible traces of gases. At present can give definite numbers. The result is that the electricity of 1 mgrm. of water, separated and communicated two balls, 1 kilometre distant, would produce an attraction between them, equal to the weight of 25,000 kilos.

The total force exerted by the attraction of an electric body upon another charged with opposite electricity always proportional to the quantity of electricity contained in the attracting as on the attracted body, therefore even the feeble electric tension of two Daniells elements acting through an electrolytic cell upon enormous quantities of electricity with which the constituent ions of water are charged, is mighty enough separate these elements and to keep them separated.

We now turn to investigate what motions of the positable molecules require the action of these forces. Let begin with the case where the conducting liquid is rounded everywhere by insulating bodies. Then electricity can enter, none can go out through its surface but positive electricity can be driven to one side, negative to the other, by the attracting and repelling forces external electrified bodies. This process going on well in every metallic conductor is called "electric induction." Liquid conductors behave quite like metals under these conditions. Prof. Wüllner has proved that our best insulators, exposed to electric forces for a time, are charged at last quite in the same way as would be charged in an instant. There can be no doubt that even electromotive forces going down to less than $\frac{1}{100}$ Daniell produce perfect electrical equilibrium in the interior of an electrolytic liquid.

Another somewhat modified instance of the effects is afforded by a voltametric cell containing electrodes of platinum, which are connected with Daniell's cell, the electromotive force of which is sufficient to decompose the electrolyte. Under this condition the ions carried to the electrodes cannot give their electric charges. The whole apparatus behaves was first accentuated by Sir W. Thomson, like a denser of enormous capacity.

Observing the polarising and depolarising current a cell containing two electrodes of platinum, hermetically sealed and freed of all air, we can observe these phenomena with the most feeble electromotive forces of Daniell, and I found that down to this limit the capacity of the platinum surfaces proved to be constant. By taking greater surfaces of platinum I suppose it will be possible to reach a limit much lower than that. If

nical force existed besides that of the electrical charges ch could bind all the pairs of opposite ions together, required any amount of work to be vanquished, an rior limit to the electromotive forces ought to exist, ch forces are able to attract the atoms to the elec- les and to charge these as condensers. No pheno- non indicating such a limit has as yet been discovered, l we must conclude therefore that no other force resists motions of the ions through the interior of the liquid n the mutual attractions of their electric charges.

On the contrary, as soon as an ion is to be separated m its electrical charge we find that the electrical forces the battery meet with a powerful resistance, the over- wering of which requires a good deal of work to be ne. Usually the ions, losing their electric charges, e separated at the same time from the liquid; some of em are evolved as gases, others are deposited as id strata on the surface of the electrodes, like gal- noplastic copper. But the union of two constituents ving powerful affinity to form a chemical compound, as u know very well, produces always a great amount of at, and heat is equivalent to work. On the contrary, decomposition of the compound substances requires work, because it restores the energy of the chemical forces, hich has been spent by the act of combination.

Metals uniting with oxygen or halogens produce heat the same way, some of them, like potassium, sodium, nc, even more heat than an equivalent quantity of ydrogen; less oxidisable metals, like copper, silver, latinum, less. We find therefore that heat is generated hen zinc drives copper out of its combination with the ompound halogen of sulphuric acid, as is the case in a Daniell's cell.

If a galvanic current passes through any conductor, a metallic wire, or an electrolytic fluid, it evolves heat. Mr. Prescott Joule was the first who proved experimentally hat if no other work is done by the current the total mount of heat evolved in a galvanic circuit during a ertain time is exactly equal to that which ought to have een generated by the chemical actions which have been erformed during that time. But this heat is not evolved t the surface of the electrodes, where these chemical ctions take place, but is evolved in all the parts of the ircuit, proportionally to the galvanic resistance of every art. From this it is evident that the heat evolved is an mmediate effect, not of the chemical action, but of the galvanic current, and that the chemical work of the battery has been spent in producing only the electric action.

If we apply Faraday's law, a definite amount of elec- tricity passing through the circuit corresponds to a definite amount of chemical decomposition going on in every electrolytic cell of the same circuit. According to the theory of electricity the work done by such a definite quantity of electricity which passes, producing a current, is proportionate to the electromotive force acting between both ends of the conductor. You see therefore that the electromotive force of a galvanic circuit must be, and is indeed, proportional to the heat generated by the sum of all the chemical actions going on in all the electrolytic cells during the passage of the same quantitity of electricity. In cells of the galvanic battery chemical forces are brought into action able to produce work; in cells in which decomposition is occurring work must be done against opposing chemical forces; the rest of the work done appears as heat evolved by the current, as far as it is not used up to produce motions of magnets or other equivalents of work.

Hitherto we have supposed that the ion with its electric charge is separated from the fluid. But the ponderable atoms can give off their electricity to the electrode, and remain in the liquid, being now electrically neutral. This makes almost no difference in the value of the electro- motive force. For instance, if chlorine is separated at the anode, it will remain at first absorbed by the liquid; if the solution becomes saturated, or if we make a vacuum over the liquid, the gas will rise in bubbles. The electro- motive force remains unaltered. The same may be observed with all the other gases. You see in this case that the change of electrically negative chlorine into neutral chlorine is the process which requires so great an amount of work, even if the ponderable matter of the atoms remains where it was.

The more the surface of the positive electrode is covered with negative atoms of the anion, and the negative with the positive ones of the cation, the more the attracting force of the electrodes exerted upon the ions of the liquid is diminished by this second stratum of opposite electricity covering them. On the contrary, the force with which the positive electricity of an atom of hydrogen is attracted towards the negatively charged metal increases in proportion as more negative electricity collects before it on the metal, and the more negative electricity collects behind it in the fluid.

Such is the mechanism by which electric force is con- centrated and increased in its intensity to such a degree that it becomes able to overpower the mightiest chemical affinities we know of. If this can be done by a polarised surface, acting like a condenser, charged by a very mode- rate electromotive force, can the attractions between the enormous electric charges of anions and cations play an unimportant and indifferent part in chemical affinity?

You see, therefore, if we use the language of the dualistic theory and treat positive and negative electrici- ties as two substances, the phenomena are the same as if equivalents of positive and negative electricity were attracted by different atoms, and perhaps also by the different values of affinity belonging to the same atom with different force. Potassium, sodium, zinc, must have strong attraction to a positive charge; oxygen, chlorine, bromine to a negative charge.

Faraday very often recurs to this to express his convic- tion that the forces termed chemical affinity and electri- city are one and the same. I have endeavoured to give you a survey of the facts in their mutual connection, avoiding, as far as possible, introducing other hypotheses, except the atomic theory of modern chemistry. I think the facts leave no doubt that the very mightiest among the chemical forces are of electric origin. The atoms cling to their electric charges and the opposite electric charges cling to the atoms. But I don't suppose that other molecular forces are excluded, working directly from atom to atom. Several of our leading chemists have begun lately to distinguish two classes of com- pounds, molecular aggregates and typical compounds. The latter are united by atomic affinities, the former not. Electrolytes belong to the latter class.

If we conclude from the facts that every unit of affinity of every atom is charged always with one equivalent either of positive or of negative electricity, they can form com- pounds, being electrically neutral, only if every unit charged positively unites under the influence of a mighty electric attraction with another unit charged negatively. You see that this ought to produce compounds in which every unit of affinity of every atom is connected with one and only with one other unit of another atom. This is, as you will see immediately, indeed, the modern chemical theory of quantivalence, comprising all the saturated compounds. The fact that even elementary substances, with few exceptions, have molecules composed of two atoms, makes it probable that even in these cases electric neutralisation is produced by the combination of two atoms, each charged with its electric equivalent, not by neutralisation of every single unit of affinity.

But I abstain from entering into mere specialities, as, for instance, the question of unsaturated compounds; perhaps I have gone already too far. I would not have dared to do it if I did not feel myself sheltered by the

authority of that great man who was guided by a never-erring instinct of truth. I thought that the best I could do for his memory was to recall to the minds of the men, by the energy and intelligence of whom chemistry has undergone its modern astonishing development, what important treasures of knowledge lie still hidden in the works of that wonderful genius. I am not sufficiently acquainted with chemistry to be confident that I have given the right interpretation, that interpretation which Faraday himself would have given perhaps, if he had known the law of chemical quantivalence, if he had had the experimental means of ascertaining how large the extent, how unexceptional the accuracy of his law really is; and if he had known the precise formulation of the law of energy applied to chemical work, and of the laws which determine the distribution of electric forces in space as well as in ponderable bodies transmitting electric current or forming condensers. I shall consider my work of to-day well rewarded if I have succeeded in kindling anew the interest of chemists for the electro-chemical part of their science.

At the conclusion of the lecture Prof. Roscoe made the following remarks :—

"The pleasing duty now devolves upon me of proposing a vote of thanks to our distinguished friend for his interesting, suggestive, and most appropriate address.

"Prof. Helmholtz has shown us that Faraday's conception of electricity is in exact accordance with the most modern developments of this science. He has told us that although Faraday was unacquainted with the technical details of mathematics, all his conclusions are capable of the most exact mathematical expression, and that our great experimentalist possessed the spirit and thoughts characteristic of a truly mathematical mind. But our lecturer has gone further, for upon Faraday's well-known law of electrolysis he has founded a new electro-chemical theory, which reveals to us chemists, conclusions of the utmost importance. He tells us as the results of the application of the modern theory of electricity to Faraday's great experimental law, that the atom of every chemical element is always united with a definite unvarying quantity of electricity. Moreover—and this is most important—that this definite amount of electricity attached to each atom stands in close connection with the combining power of the atom which modern chemistry terms quantivalence. For if the amount of electricity belonging to the monad atom be taken as the unit, then that of the dyad atom is two, of the triad atom three, and so on.

"Hence then, thanks first to Faraday and now to Helmholtz, chemists have now a new and unlooked-for confirmation of one of their most important doctrines from the science of electricity.

"These, Ladies and Gentlemen, are indeed sufficient grounds for our claiming Prof. Helmholtz as a chemist, and justify me in requesting that he will allow his name to be placed on the list of Honorary Fellows of the Chemical Society.

"I have much pleasure in proposing a hearty vote of thanks to the Faraday Lecturer for the year."

This proposal was seconded by Prof. Tyndall.

NOTES

MR. CLARENCE KING has resigned his position as Director of the Geological Survey of the United States. It has long been no secret that he wished to retire from an appointment which confined him chiefly to executive functions, left him with practically no time for independent scientific work, and hampered him in those mining and other financial operations in which he is understood to have large investments. In a letter [illegible] ult., addressed to the President of the United [illegible] that he believes he "can render more important service to science as an investigator than as the head of an executive bureau." All well-wishers to the cause of geology must hope that this belief will be fully justified; that the relief he will obtain from official trammels will enable him once more to devote to geological research the energy and experience which have already borne such good fruit. His tenure of office in the Geological Survey has hardly been long enough to enable him fully to develop the plans he had sketched out for the vigorous prosecution of the Survey as a truly national undertaking, alike creditable to the scientific spirit of the Republic and important to the development of its industrial resources. But he will be held in honourable remembrance as the first head of the National Survey, and as having taken a leading share in its initial organisation. It is reported that Mr. J. W. Powell, so long and well known by his work in the Rio Colorado basin, is to be the new director.

A WISH having been expressed by certain members of the Torquay Natural History Society to have a portrait of Mr. William Pengelly, F.R.S., &c., and he having kindly consented to sit for the same, a committee has been formed for carrying the suggestion into effect. The portrait will, at Mr. Pengelly's request, be placed in the museum of the Society, Torquay. It was at first proposed to limit the list of subscribers to members of the Torquay Natural History Society, but as many members of the Devonshire Association, and other friends having expressed a wish to join in the work, it has been decided to make the contribution general. Subscriptions will be received by the hon. treasurer, Mr. Robert Kitson, Torquay Bank.

THE Royal Academy of Sciences of Turin gives notice that from January 1, 1879, the new term for competition for the Bressa Prize has begun, to which, according to the testator, scientific men and inventors of all nations will be admitted. The prize will therefore be given to the scientific author or inventor, whatever be his nationality, who during the years 1877-78, "according to the judgment of the Royal Academy of Sciences of Turin, shall have made the most important and useful discovery, or published the most valuable work on physics, experimental science, natural history, mathematics, chemistry, physiology and pathology, as well as geology, history, geography and statistics." The term will be closed at the end of December 1882. The value of the prize amounts to 12,000 lire. The prize will in no case be given to any of the national members of the Academy of Turin, resident or non-resident.

THE Literary and Philosophical Society of Manchester recently completed the first century of its existence. Dr. Angus Smith is writing a history of the Society since its foundation, which will be read at an early meeting, and no doubt published in its *Proceedings*.

WE are glad to learn that the appeal on behalf of Mr. Smerdon, who has done such good work as foreman of the Kent's Cavern explorations, has resulted in a sum sufficient to procure him an annuity of 10*l*.

THE results of appointing a totally inexperienced and untrained man to the head of the Registrar-General's department, before the taking of the census, are already beginning to be felt. Complaints of mismanagement are rife—whole streets in London not served with the census-papers, and in many cases papers which were delivered have not yet been collected, and run the risk of being utilised for fire-lighting purposes. Certainly the interests of the country would have been best served by appointing Dr. Farr to the post of Registrar-General until after the census work had been completed. Dr. Farr's long experience would have been of great service, and these useful errors would have been [illegible] ing like scientific matters.

THERE was [illegible] subject of Technical Education [illegible] ation in the [illegible] ther night, on the

Anderson to appoint a roving Commission to inspect the al schools of the Continent. The fact is, as Mr. Mundella l out, we know quite well what is wanted here, and if the uilds would only spend the amount of money they ought here need be no want of technical instruction for all who pared to take advantage of it. As it is, such institutions us College, the Mason College, and others are putting a e scientific technical education within the reach of all and what is really wanted is the teaching of elementary in all our primary schools. The House was counted out motion.

EETING for the purpose of forming a society for the ment of chemical industry was held on Monday after- the rooms of the Chemical Society, Burlington House, ly, Prof. Roscoe presiding. The chairman explained some time the want of a Society had been felt, the which was the advancement of chemical industry in the Kingdom. Its main purpose would be to bring together intervals all those who possessed chemical, physical, neering knowledge, and who used this knowledge in ation of chemical action on a manufacturing scale, and the charge of or an interest in chemical industries. It erwards prove desirable to found a distinct branch of eering profession, who might be designated as chemical . He drew attention to the advantages which would accrue to the various branches of chemical industry by lishment of such an organisation. Briefly stated, its ould be to enable persons interested in chemical in- o meet, to correspond, and to interchange ideas improvements in the various processes, to publish n relating thereto by means of a journal or otherwise, and dispose of property for such purposes, and to do hings incidental or conducive to the objects aimed at. oe concluded by moving that it was desirable to form ciety as that suggested. This was seconded by Mr. l carried. Formal resolutions were then passed with f carrying out the object thus agreed upon.

e the following significant passage from a paper read orge Campbell, K.C.S.I., M.P., late Lieutenant- f Bengal, to the Society of Arts on March 25 last:— us who go to India know very little about agriculture l; and of agriculture under the conditions of Indian mate we know nothing whatever. The consequence at when we have attempted to show the natives how their agriculture we have generally egregiously failed, a native expression, our faces have been blackened. ect I am afraid we are not improving. The old- ivil servant, if not so literary as the new class, and much more agricultural, settled down more in the learned more of native agricultural habits and ways. inistrators, I am afraid, know very little of any kind re, and it is much the same with the native public merly they knew nothing of English literature, but great deal of the country; now they are very highly it do not know much more of agriculture than their periors."

of Curator of the Herbarium of the Royal Botanic lcutta, has been filled up by the India Office by the , on the nomination of the Director of the Royal w, of Mr. L. J. K. Brace, of New Providence, Mr. Brace was educated at Christ's Hospital, and linate post in the colony. Having turned his atten- r, he was employed by the late Governor, Mr. W. make a collection for Kew of the indigenous

rs the cultivation of Liberian coffee (*Coffea Liberica*) getically pushed in English coffee-growing colonies and possessions. This has been due to two causes:—First, the cultivation of Arabian coffee (*Coffea Arabica*) has been severely crippled in the New World by the "white fly" (*Cemiostoma caffeellum*), and in the Old by the "leaf disease" (*Hemileia vastatrix*); secondly, Liberian coffee being a more tropical plant, grows well at a zone of altitude below that which Arabian coffee requires. The produce of the plantations of the new species is now coming into commerce. At present it does not find much favour apparently in England, but in America it is better appreciated. Recent sales at New York of Ceylon-grown Liberian coffee have realised 93*s.* per cwt., or 12*s.* above the current quotation for middling plantation coffee (Arabian) in the London market. This is a result of great importance for the West Indian Islands. Liberian coffee has been found in Dominica to possess a comparative immunity from the attacks of the white fly, the ravages of which had all but completely extinguished the coffee-cultivation of the island. Not merely therefore can West Indian coffee cultivation be revived with reasonable prospect of success, but there is the additional encouragement of a ready market easy of access in the United States.

THE death is announced, at the age of seventy-five, of Sir Philip de Malpas Grey Egerton. Sir Philip was an occasional contributor to our pages.

A STRONG shock of earthquake occurred on Sunday afternoon at Chio, which has caused terrible destruction. Many houses in the principal town and thirty villages in the island are said to have been destroyed, and 4000 persons killed. Fresh shocks of earthquake occurred on Monday, and the inhabitants were taking refuge on board the steamers in the harbour. The country around and the town Tsesme, on the mainland, suffered considerably, and shocks were also felt on Monday at Zante, Syra, Smyrna, Carosto, Eubœa, and Tinos. The island of Chio, Scio, or Skio, for the name is thus variously spelt, is situated in the Ægean Sea, separated from the coast of Anatolia by a channel not more than seven miles wide where narrowest, and about fifty-three miles west of Smyrna.

SOME of our readers may be glad to learn that the French Association has resolved to curtail the number of scientific meetings in order to extend the time left for excursions and festivals. The programme includes two receptions by the Mayor of Algiers, one by the Governor-General, and a large Arabian *fête* called *Bita*, dancing and singing by native women, &c. Possibly the reported massacre of the Flatters Expedition may put a stop to these ultra-scientific festivities.

WE notice that the names of Drs. Gladstone and Tribe are down for a paper in the Physical and Chemical Section of the meeting of the French Association at Algiers, as also that of Mr. Rodwell.

AT the ordinary meeting of the Sanitary Insttiute, to be held at 9, Conduit Street, on Wednesday, April 13, at 8 p.m., the Chairman of Council, Dr. Richardson, F.R.S., will give a short address entitled, "Some Brief Suggestions on the Best Mode of dealing with Small Pox and other Infectious Diseases in the Metropolis and other large Towns," to be followed by a discussion.

MR. R. J. FRISWELL writes:—As the following novel "facts" have their origin in *Truth* there can, I presume, be no gainsaying of them. As they are entirely new and are published in a journal not so well known as a scientific paper as it ought to be, will you be good enough to give them a wider currency for the information of chemists. Their value needs no comment:—"The bomb with which the Emperor was killed appears to have been filled with nitro-glycerine, and it is unfortunate that this compound, like gun-cotton, is so easy to make. A certain amount of glycerine is taken, and to this

sulphuric and nitric acid are added. Glycerine has an affinity for water. A molecule of water is abstracted, and a molecule of nitrous acid takes its place. Nitro-glycerine may be put into the fire or it may be struck without any dangerous consequence. If however it be set on fire by a fulminant, there is an explosion. If, as stated, the Russian bombs were made of glass, there must have been small projections made in the glass shell when manufactured, filled with fulminating powder. The explosive character arises from this: Nitrogen is composed of molecules in pairs of atoms. Nitric acid contains only one atom in its molecules. Upon this atom being set free from its unstable combination in the glycerine, the two atoms of nitrogen rush together, producing a vast amount of energy of combination in the shape of heat. The gaseous products are thus heated, and an explosion takes place immediately."

A SCHOOL of Gardening and Practical Floriculture has been established at the Crystal Palace, under the superintendence of Mr. Edward Milner.

M. DAUDIGNY, electrical engineer in Paris, has sent to the Municipal Council a petition asking for authority to establish on the top of the Colonne de Juillet a large electric lamp fed by a magneto-electric machine of fifty horse-power. This enormous light is to be diffused by a large reflector of special construction.

A MOST successful experiment in theatre illumination was tried on March 30 and 31, at the Athenæum of the rue des Martyrs, Paris, with the Werdermann incandescent light. The peculiarity of it is that it can be graduated at will for scenic effects, either by introducing resistance coils or varying the velocity of the Gramme machine. These experiments were witnessed by several influential members of the Municipal Council, who on the following morning proposed an inquiry into the propriety of obliging all the theatrical managers to light their halls with electricity.

MR. F. W. PUTNAM sends us a paper on Pueblo Pottery, which he contributed to the February number of the *American Art Review*. There are some well-executed coloured illustrations of specimens of the pottery which show some little taste in colour and ornamentation.

WE have had several replies to our inquiry concerning the late Dr. Thomas Dick's astronomical instruments. They seem to have been disposed of after his death, and only one small instrument can be definitely traced. None of the instruments seem to have been of much scientific value.

MR. JOHNSTON-LAVIS writes, under date March 29:—"Vesuvius is to-night again active, lava running down the north-western slope of the cone. Only the reflection is visible from Naples. On Sunday morning a slight shock, or more correctly subterranean thunder, was felt at Casamicciola, although those in the ruins at the moment only became aware of it by the palor of others present, whose whole attention is arrested by the faintest move or noise."

A SCIENCE Students' Association has been formed in Liverpool, which includes all departments of science in its programme; the president is Mr. A. Norman Tate.

THE system of compressed-air clocks, of the use and construction of which in Paris we gave an account some time ago, is likely to have a trial in London. A Bill has been introduced into Parliament for this purpose. The number of stations proposed for the metropolis is ten.

IN the notice of the meeting of the Mathematical Society in NATURE, vol. xxiii. p. 379, Mr. Wooster Woodruff Beman's name was misspelt Benson.

LIEUT.-COL. H. COLLETT, of Meean Meer, North-West Punjab, has sent us a money-order for 3*l*. towards the John Duncan Fund. We also acknowledge receipt of 1*l*. from M. G. S.

THE additions to the Zoological Society's Gardens [illegible] past week include a Two-Spotted Paradoxure (*Nandinia* [illegible] from West Africa, presented by Mr. A. Wentworth [illegible] Golden Sparrow (*Auripasser euchlorus*) from Abyssinia, [illegible] by Mr. J. Abrahams; a Chukar Partridge (*Caccabis* [illegible] Grey Francolin (*Francolinus ponticerianus*) from India, [illegible] by M. J. M. Cornely, C.M.Z.S.; two Indian Antelopes (*Antilope cervicapra* ♂ ♂) from India, deposited; two Æthiopian Hogs (*Phacochærus æthiopicus* ♂ ♀) from South-East [illegible] Dusky Parrot (*Pionus violaceus*) from Guiana, three [illegible] Hanging Parrakeets (*Loriculus asiaticus* ♂ ♂ ♀) from [illegible] a Yellow Troupial (*Xanthosoma flavus*) from Buenos [illegible] purchased; a Fork-tailed Jungle Fowl (*Gallus furcatus*) [illegible] Java, on approval; two Four-horned Antelopes (*Tetracerus quadricornis* ♂ ♀), a Burrhel Wild Sheep (*Ovis burrhel*) [illegible] India, a Javan Adjutant (*Leptoptilus javanicus*) from [illegible] Rock-hopper Penguin (*Eudyptes chrysocome*) from the [illegible] Islands, received in exchange.

OUR ASTRONOMICAL COLUMN

THE VARIABLE STARS U CEPHEI AND U GEMINORUM.—We learn from Mr. Knott that Ceraski's short-period [illegible] in Cepheus was at a minimum on March 29 at about [illegible] G.M.T.; clouds prevented observations till 11h. 3[illegible] it had barely fallen to minimum; for two hours, [illegible] —13h. 45m., the star's light was sensibly constant—abo[illegible] On April 3 Mr. Knott again obtained a pretty com[illegible] vation; the time of minimum, taking the middle of [illegible] was 12h. 24m. G.M.T.; for nearly 2h. 30m., or from [illegible] to 13h. 36m., the star remained about 9·4m. Guide [illegible] and previous observations the following approximate [illegible] minima are inferred, and it is to be hoped that the [illegible] be well observed:—

	h. m.		h. m.		
April 8 ...	12 4	April 23 ...	11 2	May 8	
13 ...	11 43	28 ...	10 41	13	
18 ...	11 22	May 3 ...	10 20	18	

This variable has been hitherto called T Cephei in the [illegible] but Mr. Knott draws attention to the circumstance that [illegible] (*Astron. Nach.*, No. 2343) applied that designation [illegible] to another variable discovered by him, the position of [illegible] meridian observations at Moscow was found to be [illegible] 21h. 7m. 57·05s., Decl. + 68° 0′ 8″·4 for 1880·0, [illegible] accordingly follow his suggestion that the short-period [illegible] will be more properly termed U Cephei.

U Geminorum was observed by Mr. Knott at [illegible] maximum, or about 9·3 m., on April 2 and 3. Maxim[illegible] very irregular variable star are by no means easy to [illegible] precedes the principal component of Σ 1158 by 1m. Σ [illegible] is north of it 7′ 31″. Prof. Winnecke gave a series [illegible] parison stars in *Astron. Nach.*, No. 1120. Argelander's [illegible] for 1855 is R.A. 7h. 46m. 29·88s.; Decl. + 22° 22′ 41″.

While writing upon variable stars we may mention [illegible] B.A.C. 4767 is probably to be included among [illegible] was estimated 4m. by D'Agelet on May 15, 1783; it [illegible] 6m. by Lacaille, Lalande, and Piazzi, and was so [illegible] Argelander's Zone, No. 301; but although rated 5[illegible] *Uranometria Argentina* it is not found in Heis's Atlas [illegible] Uranometria of Argelander. Its place for the present [illegible] R.A. 14h. 18m. 1s., with south declination, 24° 15′·6.

THE COMET OF 1812.—Several years since, Mr. [illegible] Plummer of the University Observatory, Oxford, after [illegible] reduction of the observations made at Paris and Vivers, [illegible] we possess in their original form, found the period of [illegible] about 1½ years less than that given by Encke, so that [illegible] possible that the comet may arrive again at perihelion [illegible] present year. We have already mentioned that M. Schulhof, [illegible] Paris is engaged upon a strict investigation of the elements [illegible] this comet, and has the intention of preparing extended [illegible] rides, in the same manner that he has done for several [illegible] minor planets which had not been observed at several [illegible] tions, but the sweeping lines for every fourth day throughout [illegible] the year are given in Herr Mahn's ephemeris computed [illegible] suggestion of Prof. Winnecke, which will be found [illegible] *Vierteljahrsschrift* [illegible] *tischen Gesellschaft*, 12 Jahrg.

BIOLOGICAL NOTES

SLAVE-MAKER (POLYERGUS LUCIDUS).—The ant is as fortunate as he is energetic in his studies ants. At the December 1880, meeting of the ural Sciences of Philadelphia he read a paper at the foot of the Allegheny Mountains, near st of *Polyergus lucidus*, the American represen- egionary Ant of Hubee (*P. rufescens*), an ant that author's discovery of ant-nests, in which e associated with them, in a sort of slavery, ants ies. The nest had four gates separated a few h other; the chambers were placed one above l by tubular galleries. In an inner ovoid chamber ants, male and female, appeared; mingled with numbers were workers in three forms—major, art of *Formica Schaufussi*. A portion of the was broken into, and on the next day but one lone of the shining ants were at work, but the very busy cleaning out the galleries; a portion of engaged in an extensive migration; a few were ellows, but for the most part the deportation was males and female of the shining ants. It was re the large virgin-queens carried up the perpen- the cutting for eighteen or twenty inches, and then e of six feet over the ground and through the grass, ew seconds over a minute. The shining ants are nt of wonderful grip. One of them had fallen dea ure of another, who held her firmly grasped e thorax. Anxious to preserve the colony from s, Mr. McCook lifted the two out on the point of ife, laid them on his hand, and thrust the fine pull between the jaws of the agressor, and so teased released her fellow. The rescued ant instantly alm of his hand, threw her abdomen under her, h back curved like that of an angry cat, sawed and at the skin until an abrasion was made. The other ; fast by her mandibles only to the toothpick's point, tched out into space, her limbs stretched outwards, ind leg, which was a little bent upward, and thus perceptible support except that which her jaws gave e *quill point*, she hung outstretched for several *sant* a month after its discovery the nest was again as abundantly peopled; the winged forms of the ve however gone. Having succeeded in colonising M'Cook was able to confirm in many particulars of Huber, Forel, and others, but he never has e slave- feeding their masters. He noticed that like to move towards both warmth and light, but m to have settled the question whether they would rarial h without the light. They would appear to r ways and persons. Various experiments dish U he fact that these slave-makers always keep at une e for any attack.

ON COLOUR OF SALT COD.—During the hot and of summer in the United States the dried codfish ibit a peculiar redness of colour. These red fish, wn, patrefy comparatively quickly, and this fact, ction with the disagreeable, and in such fish unusual, s them unfit for market, so that in seasons when evails dealers in codfish suffer often very con- es. Prof. Farlow, M.D., was requested by the Fish Commission to investigate this subject, and ears in the Fish Report for 1880. In September, nt to Gloucester to examine the fish stores. The at that time hot and damp, and the codfish then ed for the market were largely affected by the red- redness disappears until the return of cool weather. s it does not appear until the fish have been landed sels, though in a few cases the colour has appeared k while still on board. A microscopical examina- that the redness was owing to a very minute plant, *rosa-persicina*, a species known to be closely related *incus*, so common in fresh-water ponds, and which ome into public notice in the States in consequence of ad *pig iron* colour which it exhales when decaying. pecies is known both in America and Europe, and has recently investigated by Cohn and others. It may some- found tinging the surface of damp ground with a nge, and the anatomist is not unfamiliar with it as growing in his macerating tubs. It would appear not to flourish or increase very rapidly at a temperature below 65° Fahr. How it got to attack the dried fish was the next question. It was found that the plants could come from many sources, for it was found present in quantities in the wood-work of the wharves and packing-stores, but above all Prof. Farlow detected it in the salt with which the fish were cured. The salt from Cadiz had even a slight rose tinge. It will be a matter of interest, which perhaps some of our readers may help to solve, as to whether this plant is known in European fish-stations. In the great Norwegian cod-fisheries the temperature may not be high enough to favour its growth. As remedies Prof. Farlow suggests care in the selection of salt, and the constant cleaning of all wood-work or vessels that may come in contact with the fish. In addition to the red alga small quantities of cells destitute of colouring-matter and arranged in fours were not unfrequently found in the infected cod-fish. These suggested the genus Sarcina, but were not *S. ventriculi*. They rather, except in the absence of colouring-matter, resembled *Gleiocapsa crepidinum*, Thuret, which species is common enough on the wood-work of the Gloucester wharves. While there is this resemblance Prof. Farlow prefers for the moment, and pending further investigation, to call it a Sarcina, and to describe it as a new species (*S. ? morrhuæ*).

MARINE ISOPODS OF NEW ENGLAND.—One of the most remarkable papers forming the extensive series of appendices to the Report of the United States Commissioners of Fish and Fisheries for 1878 is perhaps that by Oscar Harger on the marine Isopods of New England and adjacent waters. The limits chosen commence at Nova Scotia to the north and extend southwards to New Jersey. Forty-six species are recorded, and figures of these with the requisite details of anatomy are given on thirteen plates; several new species and one new genus (Syscenus) are described. It will be noted that the number of species is very considerably less than that known to frequent the British coasts, and of the former only eight are identical with British forms. This difference is very marked in the genus Sphæroma, of which genus there is but one species native to New England, while Bate and Westwood describe a dozen species belonging to this family as natives of Britain. *Limnoria lignorum*, one of the most destructive of the group, is apparently as common on the American coasts as on our own shores. It does not usually occur much below high-water mark, though Prof. Verrill has found it at a depth of ten fathoms in Casco Bay, and it was dredged by the U.S. Fish Commission at a depth of 75 fathoms in Cape Cod Bay, Massachusetts. Of the family of the Cymothoidæ, of which we believe as yet no species has been found around the British Islands, three species belonging to three different genera are in Mr. Harger's list.—To this memoir there is appended a very complete list of authorities and an alphabetical index.

STATISTICS OF DISEASE IN ITALY.—In a recent paper to the Lombard Institute, Prof. Sangalli gives statistics of the diseases which terminated fatally in the Civic Hospital of Pavia during the period 1855 to 1881. The material was 6644 bodies which came up for autopsy, and the causes of death were, in decreasing order, genuine inflammation, 4504 deaths; tuberculosis, 808; pyæmia, 337; cancer, 306; hepatic cirrhosis, 252; extravasation of blood in the brain, 254; chronic ulcer (gastric and duodenal), 72, &c. (there being 2140 deaths apart from those by true inflammation). The 4504 deaths from inflammation presented 7962 separate inflammations. The deaths from tuberculosis are seen to be about 12 per cent. The ages most exposed to that disease lie between 20 and 30; next come those between 10 and 20, and between 30 and 40, about equal. There were twelve cases between 70 and 80, and one in an old man of 84. It does not appear that one sex suffers more than the other. Cancer occurs most between 50 and 60, and most largely in liver, lymphatic glands, and stomach. The patients were largely of the peasant class, and the author cannot support Niemeyer's view, that people living in marshy districts, liable to malaria, have a certain immunity from tuberculosis. Nor do the figures confirm the asserted tendency of ulcer in the stomach to favour the development of tuberculosis. Pyæmia appeared mostly in the lungs (149 cases out of 470), pleura, 99; liver, 73, &c. In some years there was a remarkable diminution of this disorder.

THE EYE AND INTENSITY OF COLOUR.—With an apparatus consisting of two Nicols with a gypsum plate between, and a spectroscope with a third Nicol attached to the eye-piece, Herr Dobrowolsky has examined the sensibility of the eye to spectral

colours with different intensities of light (Pflüger's *Archiv*, v. 24, p. 189). From a large number of measurements it was found that, on an average, the red-colour sensation first occurred with a light-quantity equal to $\frac{1}{3283}$, while for blue the lowest amount of light was $\frac{1}{51111}$. Thus blue gives a sensation with an amount of light sixteen times less than that required for red. With rise in the degree of brightness, the increase of sensibility to red proceeds pretty regularly; but for blue the increase becomes gradually greater (with the weakest degrees of brightness this increase was = 0·22, with the strongest 0·82, with the mean 0·36). Comparing the two sensibilities together, from the maximum of light strength to the minimum, the sensibility to blue is always found to exceed that to red (maximum thirteen and a half times, minimum sixteen times, mean four times).

ISOETES LACUSTRIS.—In an interesting paper read before the Academy of Sciences of Paris (January 10, 1881), M. E. Mer calls attention to the peculiar conditions under which different forms of this fresh-water plant seem to originate in the Lake of Longemer. The basin of this lake was once occupied by a glacier, and now presents several different sorts of bottom. The soil to a depth of two to three metres is composed in part of a gravel formed of rock *débris* united by an iron cement, in part of ancient moraines, or where near the surface these will be mixed with the remains of plants and form a pretty tenacious mud. In all these situations Isoetes is to be found, but the plants differ most remarkably both as to their form, their structure, and their mode of reproduction as they are found in the different habitats. Taking the leaf-development as a guide, four varieties are easily discerned:—(1) *humilis*, growing sparsely in the gravel and sterile shallows, the leaves are not only few in number, but always of diminutive dimensions; sporange generally wanting or represented by a small cellular mass which rarely ever forms a propagule, and then these with puny leaves; (2) *stricta*, found on the borders of the lake or in the old alluvial, therefore in less sterile quarters than the preceding; leaves more numerous, stout, but still of small size; (3) *intermedia*, growing on ground formed of a mixture of mud and clay, either on the borders of the lake or at a depth of from one to two metres, leaves quite intermediate in character between the previous variety and the next; (4) *elatior*, growing on the clayey depths, with long leaves. The first form is always found isolated, and as to its asexual reproduction there is nothing more to be said; but the other three, according as they are subject to more or less heat, present each three varieties characterised by the mode of reproduction. 1. *Sporifera*, isolated individuals, mostly furnished with well-developed sporangia, stem large, roots numerous, leaves large. 2. *Gemmifera*, few fertile sporangia, but most of the leaves are furnished with propagula, and these well furnished with leaves, generally dextral, stem fairly developed. 3. *Sterilis*, individuals growing in compact masses, stems and roots slender, leaves not numerous, long and narrow, fertile sporangia very rare, and more often undeveloped masses of cells or abortive propagula. It would seem as if these facts had a practical interest to the collector, who may find in them a guide as to where to look for fertile specimens.

GEOGRAPHICAL NOTES

ON Friday, April 1, the French Geographical Society held a meeting in the large hall of the Sorbonne for the reception of Dr. Lenz on his return from Timbuctoo. M. Milne-Edwards was in the chair. Dr. Lenz, as our readers know, has been very successful, although his conclusions are adverse to the construction of a railway from the Niger to Algeria throughout the Sahara. On the following morning the Society received a telegram stating that Col. Flatters had been murdered by Touaregs at some distance from the Lebhkha Amagdor. In the evening the sad news was confirmed by an official message, stating that four starving Arabs from the mission had arrived at Ouargla, and that the Khobfa had left with four hundred mehari and camel horsemen to rescue the survivors, who were besieged south of Messaguer in the Touat region proper. Happily the news of the disaster to Col. Flatters' expedition has not yet been further confirmed, and authorities in Paris are inclined to believe that it has been much exaggerated, and that the story of the four natives has many elements of suspicion about it.

DR. LENZ, in his lecture at Paris, gave some interesting details on the present condition of Timbuctoo. Its houses a[re] brick, and the population is now only 20,000. It [is] decayed, and the inhabited part of the town is sur[rounded] great spaces covered with ruins. There are numerous and rich libraries. Dr. Lenz had a cordial reception, a night during his twenty days' stay he was present at conferences which the learned men of the city held [with] interpreter; the commentaries on the Koran formed a subject of conversation. Timbuctoo is united with the six miles off, by a series of lakes, formerly canals. [He] has also made some interesting observations on the [Niger] tending to confirm the conclusions of Rholfs and other scientific travellers as to the variety which is to be met [with] the great desert. It is really a plateau about 300 metres [in] tude, no part of it being below the level of the sea, [with] hills, sandy plains, shallow lakes, fertile oases, sterile nearly the whole surface, while beasts of prey are [rarely] met with. Dr. Lenz will contribute a full account of his to the Berlin Africa Society, in whose journal many [of] have already appeared.

IT is with sincere regret that we record the death of Karl Weyprecht, at the age of forty-three, on March consumption. Lieut. Weyprecht will be known to [fame] as the discoverer, with Lieut. Payr of Franz-Josef Land, Austro-Hungarian Expedition of 1872-4. His observations the aurora borealis were of especial value, and he has several papers on the subject. He was also the originator the scheme for establishing a series of international stations around the Pole, which is likely to be realised next year.

THE Rev. G. Brown, the well-known representative of church militant in the South Pacific, contributes to the number of the Geographical Society's *Proceedings* a [de]scriptive of a recent journey which he has made along the of New Ireland and the adjacent islands, the latter [being] Sandwich Island, Portland Islands, and New Hanover. Benjamin Bradshaw, who has spent some years in collecting natural history specimens in the Upper Zambesi region, contributes a brief paper on the Chobe River, together with sketch-map of a portion of its course, adding materially knowledge of the geography of this region. Mr. [Hale's] paper on Saráwak and Northern Borneo, lately read before Society, is also given, and is illustrated with a good map. geographical notes are full of interesting matter, one [being] account, by Mr. Sibiriakoff himself, of the voyage of the *Dickson* to the Yenisei Gulf in 1880. Another feature is clusive proof of the usefulness of the course of scientific provided by the Council for intending travellers in countries. From the last note we learn that Mr. C. [R.] ham, the indefatigable secretary, is preparing for the [press] volume of the *Journal* a sketch of the Society's work past fifty years.

IN the current number of *Les Missions Catholiques* Richard, a missionary in Algeria, commences an account journey, in company with Père Kermabon, among the Azguer tribes of the Sahara. The object of their [visit] to study this almost unknown region, and to cultivate relations with the chiefs and people generally with a formation of a missionary station. The more interesting to Père Richard's narrative, as it deals with the [region] which Col. Flatters has been now exploring with the settling the best practicable route for the projected [Trans-Saharan] railway. An entirely new map of this part of Africa, Père Richard's notes, accompanies the number.

A LATELY-ISSUED batch of *Reports* from H.M. [Consuls] vi. of last year) contains useful geographical information ing portions of South America, that relating to Chili being specially interesting at the present moment.

S AND ACADEMIES

LONDON

ch 24.—"Observations on the Loomma- ermata." (The Croonian Lecture.) By F.R.S., and Prof. J. C. Ewart, M.D. had reference to the tube-systems and thrombidæ. It was shown by injection m and the so-called blood-vascular sys- ons, save at their common origin in the sys- tems communicate through this plate ; but the one much more freely than system being the least patent, so that of two feet is maintained for a number fluid slowly permeates the stone-canal, ugh the madreporic plate. Regarding us to and in Echinus that lateral branches ial trunks to escape with the pedicels the pore plates. Each of these branches edicel, with which it escapes in the ter- ese lateral branches there also arises an hich covers the whole external surface of the shell, lying almost immediately beneath the surface epithelium, and extending from the shell to all the spines and pedicellariæ. In stained specimens the nerve-fibres and cells were traced to the capsular muscles at the bases of the spines, and delicate fibres were detected running up the spines and pedicellariæ, immediately below their epithelium. In the case of the policellariæ it appeared from several preparations that delicate fibres extended as far as the sensitive epithelial pad situated on the inner surface of each trident mandible, a short distance from the apex.

Such being the principal morphological results, the paper went on to detail a number of physiological experiments. First it was pointed out that the natural movements of echinodermata exhibit a high degree of co-ordination. Thus, for instance, all the echinoderms are able when inverted on a flat floor to right themselves. The common starfish does this by twisting the ends of two or more of its rays round, so as to bring the terminal suckers into action upon the floor of the tank, and then by a successive and similar action of the suckers further back in the series the whole ray is progressively twisted round, so that its ambulacral surface is applied flat against the floor. The rays which perform this action twist their spirals in the same direction, and by this concerted action drag the disk and the remaining rays over themselves as a fulcrum. Other species of starfish which have not their ambulacral suckers sufficiently developed to act in this way execute their righting movements by doubling under two or three of their adjacent rays, and turning a somersault over them, as in the previous case. Echinus rights itself when placed on its aboral pole, by the successive action of two or three adjacent rows of suckers—so gradually rising from aboral pole to equator, and then as gradually falling from equator to oral pole. Spatangus executes a similar manœuvre entirely by the successive pushing and propping action of its longer spines.

Experiments in stimulation showed that all the echinoderms observed sought to escape from injury in a direct line from the source of irritation. If two points of the surface are stimulated the direction of escape is the diagonal between them. When several points all round the animal are simultaneously stimulated the direction of advance becomes uncertain, with a marked tendency to rotation upon the vertical axis. If a short interval of time be allowed to elapse between the application of two successive stimuli the direction of advance will be in a straight line from the stimulus applied latest. If a circular band of injury be quickly made all the way round the equator of echinus, the animal crawls away from the broadest part of the band, *i.e.* from the *greatest amount* of injury.

The external nerve plexus supplies innervation to three sets of organs—the pedicels, the spines, and the pedicellariæ ; for when any part of the external surface of echinus is touched, all the pedicels, spines, and pedicellariæ within reach of the point that is touched immediately approximate and close in upon the point, so holding fast to whatever body may be used as the instrument of stimulation. In executing this combined movement the pedicellariæ are the most active, the spines somewhat slower, and the pedicels very much slower. If the shape of the stimulating body admits of it, the forceps of the pedicellariæ seize the body and hold it till the spines and pedicels come up to assist.

And here we have proof of the function of the pedicellariæ. In climbing perpendicular or inclined surfaces of rock covered with waving seaweeds it must be no small advantage to an echinus to be provided on all sides with a multitude of forceps adapted, as described, to the instantaneous grasping and arresting of a passing frond ; for in this way not only is an immediate hold obtained, but a moving piece of seaweed is held steady till the pedicels have time to establish a further and more permanent hold upon it with their sucking disks. That this is the chief function of the pedicellariæ is indicated by the facts that (1) if a piece of seaweed is drawn over the surface of an echinus this wonderfully tenacious grasp of the forceps is timed as to its duration with an apparent reference to the requirements of the pedicels, for after lasting about two minutes (which is about the time required for the suckers to bend over and fix themselves to the object held by the pedicellariæ, if such should be a suitable one) this wonderfully tenacious grasp is spontaneously released ; and (3) that the most excitable part of the trident pedicellariæ is the inner surface of the mandibles, about a third of the way down their serrated edges, *i.e.* the part which a moving body cannot touch without being well within the grasp of the forceps.

When the forceps are closed they may generally be made immediately to expand by gently stroking the external surface of their bases.

With regard to stimulation of the spines, if severe irritation be applied to any part of the external or internal surface of an echinus, the spines all over the animal take on an active bristling movement. The tubercles at the bases of the spines are the most irritable points on the external surface.

With regard to stimulation of the pedicels, if an irritant be applied to any part of a row, all the pedicels in that row retract in succession from the seat of stimulation, but the influence does not extend to other rows. A contrary effect is produced by applying an irritant to any part of the external nerve-plexus, all the pedicels being then stimulated into increased activity. Of these antagonistic influences, the former, or inhibitory one, is the stronger, for if they are both in operation at the same time the pedicels are retracted.

Starfish (with the exception of brittle-stars) and echini crawl towards, and remain in, the light; but when their eye-spots are removed they no longer do so. When their eye-spots are left intact they can distinguish light of very feeble intensity.

Experiments in section showed that single rays detached from the organism crawl as fast and in as determinate a direction as do entire animals. They also crawl towards light, away from injuries, up perpendicular surfaces, and when inverted, right themselves. Dividing the ray-nerve in any part of its length has the effect of destroying all physiological continuity between the pedicels on either side of the division. Severing the nerve at the origin of each ray, or severing the nerve-ring between each ray, has the effect of totally destroying all co-ordination among the rays; therefore the animal can no longer crawl away from injuries, and when inverted it forms no definite plan for righting itself. Each ray acting for itself, without reference to the others, there is as a result a promiscuous distribution of spirals and doublings, which as often as not are acting in antagonism to one another. This division of the nerve usually induces, for some time after the operation, more or less tetanic-like rigidity of the rays. This operation however, although so completely destroying physiological continuity in the rows of pedicels and muscular system of the rays, does not destroy or perceptibly impair physiological continuity in the external nerve-plexus; for however much the nerve-ring and nerve-trunks may be injured, stimulation on the dorsal surface of the animals throws all the pedicels and muscular system of the rays into active movement. This fact proves that the pedicels and the muscles are all held in nervous connection with one another by the external plexus, without reference to the integrity of the main trunks.

If a cork-borer be rotated against the external surface of an echinus till the calcareous substance of the shell is reached, and therefore a continuous circular section of the overlying tissues effected, the spines and pedicellariæ within the circular area are physiologically separated from those without it, as regards their local reflex irritability. That is to say, if any part of this circular area is stimulated, all the spines and pedicellariæ within that area immediately respond to the stimulation in the ordinary way, while none of the spines or pedicellariæ surrounding the area are affected, and conversely. Therefore it is concluded that the function of the spines and pedicellariæ of localising and gathering round a seat of stimulation is exclusively dependent upon the external nervous plexus. If the line of injury is not a closed curve, so as not to produce a physiological island, the stimulating influence will radiate in straight lines from its source, but will not irradiate round the ends of the curve or line of injury.

Although the nervous connections on which the spines and pedicellariæ depend for their function of localising and closing round a seat of stimulation are thus shown to be completely destroyed by injury of the external plexus, other nervous connections, upon which another function of the spines depends, are not in the smallest degree impaired by such injury. This other function is that which brings about the general co-ordinated action of all the spines for the purposes of locomotion. That this function is not impaired by injury of the external plexus is proved by severely stimulating an area within a closed line of injury on the surface of the shell; all the spines over the whole surface of the animal then manifest their bristling movements, and by their co-ordinated action move the animal in a straight line of escape from the source of irritation.

We have, therefore, to distinguish between what may be called the local reflex function of the spines, which they show in common with the pedicellariæ, and which is exclusively dependent upon the external plexus, and what we may call the universal reflex function of the spines, which consists in general co-ordinated action for the purposes of locomotion, which is wholly independent of the external plexus. For therefore, this more universal function must depend upon some other set of nervous connections (which, however, the author were not able to detect histologically), and experiment proves that these, if present, are distributed over all the internal surface of the shell. For if the internal surface be painted with acid or scoured out with emery paper and brick-dust, the spines and pedicellariæ, after a short period of increased activity at first, become perfectly quiescent, lie flat, and lose both their tetaneity and irritability. After a few hours, however, the tetaneity and irritability of the spines return, though in a less degree, and also those of the pedicellariæ in a more marked degree. These effects take place over the whole external surface of the shell, if the whole of the internal surface be painted with acid or scoured with brick-dust; but if any part of the internal surface be left unpainted or unscoured, the corresponding part of the external surface remains uninjured. From these experiments it is concluded:—(1) that the general co-ordination of the spines is wholly dependent on the integrity of the hyponeural or internal plexus; (2) that the hypothetical internal plexus is everywhere in intimate connection with the external plexus through the calcareous substance of the shell; and (3) that complete destruction of the former, while profoundly modifying through shock the functions of the latter, nevertheless does not wholly destroy them.

Echini may be divided into pieces, and the pedicels and pedicellariæ upon these pieces will continue to exercise functions of local reflex irritability, however small the pieces may be. If an entire double row of pedicels be divided with a segment and then placed upon its aboral end, it may be seen to right up on its oral end by the successive action of its pedicels, and then proceed to crawl about the floor of the tank. We have therefore to meet the question: Is the action of the ambulacral feet in executing these righting movements of a merely reflex kind, *a*, *b*, and *c* first securing their hold on the tank floor in response to the stimulus supplied by contact, and then by their combined tilting over the globe, till *d*, *e*, and *f* are able to take hold, and so on; *or* does the righting action depend upon nervous co-ordination? Experiments showed that both principles are combined, the action of the pedicels being serial, but also co-ordinated by nervous co-ordination. This conclusion is sustained by the experiment of shaving off the spines and pedicels over the whole of one hemisphere, *i.e.* the half from the equator to the oral pole. When then inverted and forced to use their ambulacral pedicel-rows, the echini reared themselves upon their oral pole, and then, having no more pedicels wherewith to continue the manœuvre, came to rest. This rest was permanent, the aboral pole remaining, if accidents were excluded, upon its equator when it died. The question then here seems to resolve itself into this: Is the mechanism of the pedicels so constructed as to ensure that their serial action shall always take place in the same direction? For if it can be shown that their serial action may take place indifferently in either direction it would follow that the persistent position which the partly shaved echini continue reared upon their oral pole is the expression of some stimulus (such as a sense of gravity) continuously acting upon some central apparatus, and impelling the latter to a continuous, though fruitless, endeavour to co-ordinate the absent pedicels. If the pedicels are able to act serially in either direction, there is no more reason why a partly-shaved echinus should remain permanently reared upon its oral pole than that it should remain permanently inverted upon its aboral pole; and therefore the fact that in the latter position the pedicels bring about an immediate rotation of the animal, while in the former and quite as unnatural position, they hold the animal in persistent stasis—this fact tends to show that the righting movements of the pedicels are something more than serial. Thus the whole question as between the two hypotheses comes to this: to whether the pedicels are able to act serially from the oral to the aboral pole. Observation showed that they are so, for echini spontaneously rear themselves from their normal position at the oral pole, to the position of resting upon their equators. For as additional evidence that the righting movements are also assisted by some centralising influence, is the fact that when the evolution is nearly completed by the pedicel-rows engaged in executing it, the lower pedicels in the other rows are seen strongly protruded and curved downwards, in anticipation of shortly coming into contact with the floor of the tank.

1 by observations on Newton's rings,
1000 observations on the rings them-
selves. The thicknesses determined by direct observations on Newton's rings and those in the corrected table rarely differ by 1 per cent., while Newton's scale in parts differs from both by as much as 10 per cent. of the thickness. The films were formed from a solution of oleate of soda in glycerine, with a little nitrate of potash added to increase their electric conductivity. They were blown in a glass case from which the outer air could be excluded. Precautions were taken to keep the air in contact with the films inside the case at a proper humidity. These consisted in placing disks containing the solution at the bottom of the case and suspending within it sheets of blotting-paper, the lower edges of which dipped into the liquid. A hair hygrometer indicated changes in the humidity of the interior. The resistance of the films was measured by piercing them with gold wires, which were connected with the electrodes of a quadrant electrometer. The resistance of the film between the needle was calculated by comparing the deflection caused by the difference of potential of the two wires when a current was passing through the film with that produced by the difference of potential above and below a known resistance placed in the same circuit. The specific resistance of the liquid from which the films were formed was measured by a method identical in principle with the above. The liquid was contained in a glass tube with turned-up ends. Platinum wires were cemented into small holes drilled in the straight part of the tube, and their difference of potential compared with that of two points in the same circuit separated by a known resistance. This method has the great advantage of getting rid of any difficulties connected with polarisation. Test experiments on sulphuric acid proved the method to give results agreeing with those of Kohlrausch, who employed alternating currents and Wheatstone's bridge. The results of the experiments may be summed up as follows:—It is difficult to form a soap film under conditions precluding a slight evaporation or absorption of water, but the more nearly these conditions are attained the more closely does the specific resistance of the film agree with that of the liquid in mass. The films observed under the most favourable conditions obeyed Ohm's law with great accuracy, and much better than the others. The films indicate no approach to a thickness equal to the diameter of molecular attraction. A soap-film may even in an inclosed space readily lose 23 out of 57·7 volumes of water contained in every 100 volumes of the solution, when special precautions are not taken to maintain the surrounding space in a constant hygrometric condition. Prof. Ayrton suggested that in measuring the liquid and film the distance between the electrodes should be varied. Prof. Guthrie pointed out that the results of Prof. Reinold and Kohlrausch agreed with his own in showing that the conductivity of liquids obeyed Ohm's law.

Geological Society, March 23.—Robert Etheridge, F.R.S., president, in the chair.—Rev. Daniel Dutton and Capt. George Ernest A. Ross were elected Fellows of the Society.—The following communications were read:—The Upper Greensands and chloritic marl of the Isle of Wight, by C. Parkinson, F.G.S. In this paper the author described the Upper Greensand as exposed at St. Lawrence and along the Undercliff. At the base of the St. Lawrence Cliff there are hard bands of blue chert from which astaciform Crustacea have been obtained; and quite recently, in a large boulder of the same material lying on the beach, there were found the remains of a Chelonian, referred by Prof. Owen to the family Paludinidæ, and named by him *Trachyaspis hilli*. The presence of these fresh-water organisms was thought to imply a connection with the Wealden continent. The chert-bed, 2 feet thick, was regarded by the author as marking the boundary between the Gault and the Greensand. Above it the author described 56 feet of compact red and yellow sands, of which the first 20 feet are unfossiliferous, the upper 32 feet show traces of organic remains; between them there is a fossiliferous zone 4 feet in thickness, containing *Ammonites inflatus*, *A. auritus*, and species of *Pinna*, *Cucullæa*, *Arca*, and *Trigonia*, and immediately below this a separate band containing an undetermined species of Ammonite. These sands are followed by 38 feet of alternate beds of hard chert and coarse greensand, having at the bottom 6 feet of inferior building-stone surmounted by 5 feet of freestone. The latter contains *Ammonites rostratus*, and the cherts various fossils, chiefly bivalves. *Clathraria Lyelli* also occurs at this level. Above the greensands come 6 feet of chloritic marl: the upper 3½ feet fossiliferous, with a base of hard phosphatic nodules containing crushed specimens of *Pecten asper*; the lower 2½ feet compact, with darker grains and few fossils. The author compared the sections of

this series given by Capt. Ibbetson and Dr. Barrois; his own views closely correspond with those of the latter writer.—On the flow of an ice-sheet, and its connection with glacial phenomena, by Clement Reid, F.G.S. The author considers that the boulder-clays have been formed beneath an ice-sheet, and consequently there must have been formerly a huge mass of ice, which would have to flow 500 miles on a nearly level surface, and then to ascend a gentle slope for nearly another 100 miles. He does not think a great piling up of the ice at the North Pole can be assumed to account for this motion. This he explains by the gradual passage of the earth's heat through the mass of ice, raising the temperature of the whole instead of liquefying the surface-layer. As the heat passes upwards it raises the temperature of a particular layer, causes it to expand, and so to put a strain upon the layer above, and then to rupture it. The broken part spreads out, reunites by regelation, and then, receiving the heat from the layer below, again expands and ruptures the layer next above. Thus the movement is from the base upwards rather than from the surface downwards. The author estimates that the ice-sheet in Norfolk was only about 400 feet thick, because boulder-clay does not appear above that level, but only coarse boulder-gravel; in North Yorkshire it extends up to about 900 feet. The author considers that the shell-bed of Moel Tryfaen were not deposited under water, but thrust up-hill by this advancing ice-sheet.—Soil-cap motion, by R. W. Coppinger, communicated by the the president. The author described numerous cases in Patagonia where the stumps, &c., of trees are to be seen in the marginal waters of the sea and of lakes. These, together with stones and rocks, sometimes simulating perched blocks, he considers to have been brought down by the motion of the soil-cap—a thick spongy mass resting upon rock often worn smooth by the action of ice, and so sliding down the more easily under the influence of vegetation. The appearances are not unlike those due to subsidence; but he point out that all the evidence is in favour of recent upheaval, instead of subsidence.

Victoria (Philosophical) Institute, April 4.—Prof. Balfour Stewart, F.R.S., read a paper on the visible universe, which he described in general terms, and then sought to trace its history back, giving a passing sketch of the views of the theologian on the one hand and the materialist on the other, through its many forms to its first logical origin. A discussion ensued, which was taken part in by several who had been specially invited, the question being treated from the scientific and the metaphysical point of view.

Paris

Academy of Sciences, March 28.—M. Wurtz in the chair.—On account of the death of M. Delesse, the Academy went early into Secret Committee.—The following papers were communicated:—On the heats of formation of diallyl, chloro-compounds, and i aldehyde, by MM. Berthelot and Ogier.—Remarkable case of globular lightning: diffuse flashes near the surface of the ground, by M. Trécul. On August 25, 1880, during a thunderstorm, and in full daylight, he saw a very brilliant body, slightly elongated (say 38 to 40 ctm. long by 25 ctm. broad), and with conical ends, pass from one part of a dark cloud to another; and before disappearing, a small part of its substance fell, *as if having weight*, and gave a luminous vertical track with reddish globules at the sides. It divided in falling, and disappeared a little above the houses. The other phenomenon M. Trécul has often noticed in thunderstorms, viz, a band of feeble light, momentarily illuminating a street and reaching right across it, or only part of the width. The author adds some reflections on the phenomena he described on August 23, 1880.—On the representation of numbers by forms, by M. Poincaré.—On a class of linear differential equations, by M. Halphen.—On the reduction of positive quaternary quadratic forms, by M. Charve.—New researches on the winter egg of phylloxera; its discovery at Montpellier, by M. Mayet. To find the winter egg in Languedoc, he recommends searching on young American vines of the species *Riparia*, and only where galls are observed on the leaves; further, only raising the bark of two or three years (preferably the former).—Attempted application of the principle of Carnot to electro-chemical actions, by M. Chaperon.—On the construction of photophonic selenium receivers, by M. Mercadier. These consist of two strips of brass (1 to 4 or 5m. long) separated by two strips of parchment paper, the whole wound in a close spiral, and held in position by two wooden pieces with screws. The arrangement is heated to the melting-point of selenium and a pencil of selenium passed over the surface. These receivers are continuous, are easily made and repaired, have the same properties as the discontinuous ones, &c. It is possible to give them a very variable resistance, from 8000 to 20000 ohms., without their ceasing to act well. A large number arranged in series or in surface may be placed in the same circuit, and many persons enabled to hear photophonic effects at once. In one of M. Mercadier's arrangements the sounds were heard at 2 or 3 m. distance.—On the causes of distinctness in telephonic transmission, by M. Gaiffe. He notices the disturbing effects of friction of wires with each other, and of vibrations caused by wind or otherwise.—On the preparation and the properties of protochloride of chromium, and of sulphate of protoxide of chromium, by M. Moissan.—On phosphoplatinic combustion, by M. Pomey.—Products of action of hydrochlorate of ammonia on glycerine, by M. Etard.—Irian grafts; pathogeny of cysts and epithelial tumours of the iris, by M. Masse. He has found (with rabbits) that small pieces of the conjunctiva or of skin introduced into the anterior chamber of the eye, through an incision made in the cornea, are pretty easily grafted on the iris. After some time the graft takes the form of a fine small cyst very like the cysts or epithelial tumours which sometimes occur on the human iris after wounds of the cornea. The grafts of skin consist of a thick layer of pavement epithelium, with connective tissue beneath united to that of the iris. In the case of the grafts of conjunctiva a true cystic cavity is developed. Hairs with their follicles may also be grafted on the iris. Rothmund's theory of the cause of cysts and tumours of the eye (pieces of skin, &c., carried through a wound) is supported and verified by these researches.—On the nature and origin of the appearance of old eruptive rocks observed in the region of volcanoes with craters of Puy-de-Dôme, by M. Julien.

Vienna

Imperial Academy of Sciences, March 31.—V. in the chair.—The following papers were read:—H. Wild, the temperatures of the Russian Empire.—Dr. H. Goldschmidt, on the action of molecular silver on carbon chlorides.—Dr. Hocevar, on some experiments made with a Holtz's machine.—R. Andrasch, synthesis of methylated parabanic acid, of methylthioparabanic acid, and of thiocholestrophane.—Dr. Emil Holub and A. v. Pezeln, ornithological results of Holub's voyage in South Africa.—Kachler and Spitzer, on Borneol- and camphocarbonic acid.—Max Groger, on sulphochromates.—Alb. Ott, contribution to the dissociation of tungsten from antimony, silver and iron, with an analysis of a so-called pseudo-meteor.

LIGHTNING CONDUCTORS.

Experience, accumulated since the time of Benjamin Franklin, proves conclusively that a Conductor made of Copper of adequate size is the best of all appliances for the protection of every description of building from the destructive effects of lightning.

NEWALL & CO.'S
PATENT COPPER LIGHTNING CONDUCTOR,

As applied in all kinds of Buildings and Shipping in all parts of the world with unvarying success; is the most Trustworthy, most Effective, and also the Cheapest Conductor ever offered to the public.

It is simple in its application, no insulation being required, and it costs only one shilling per foot for the standard size, which ensures safety in any ...stance.

ISLAND LIFE:

THE PHENOMENA AND CAUSES OF INSULAR FAUNAS AND FLORAS, INCLUDING A REVISION ATTEMPTED SOLUTION OF THE PROBLEM OF GEOLOGICAL CLIMATES. By ALFRED RUSSEL WALLACE, Author of "The Malay Archipelago," "The Geographical Distribution of Animals," &c.

Mr. Wallace discusses in an admirably clear and able manner the questions of geological climate and time . . . such are few of the great problems discussed in this most instructive volume—a volume that ought to interest every thoughtful reader. : its theories are likely to meet with keen criticism from Mr. Wallace's fellow-scientists, his volume ought more than any other ow of to spread among the intelligent reading public a knowledge of and interest in some of the most momentous scientific ems of our time."—*Times.*

'His wonderful grasp of detail, depth of insight, and breadth of view remind one at every turn of Darwin, with whom he the honours of discovery in the theory of natural selection; but beyond this he has a lightness of touch, a beauty of style, a ingenuity in unravelling intricate difficulties which are all his own. . . . 'Island Life' is a work to be accepted almost ut reservation from beginning to end. . . . Whoever reads his book must be charmed with it."—*St. James's Gazette.*

'The work throughout abounds with interest. . . . It may be read with equal pleasure by those who are already acquainted the general principles of distribution and by those who wish for the first time to learn something about modern biological aphy."—*Athenæum.*

'We have said enough to show that Mr. Wallace is led to discuss subjects of great interest to speculative minds. With its rous special maps 'Island Life' ought to prove as interesting as it is instructive."—*Pall Mall Gazette.*

MACMILLAN AND CO., LONDON.

A HANDBOOK OF DOUBLE STARS.

a Catalogue of Twelve Hundred Double Stars, and extensive Lists of Measures. With additional Notes bringing the ures up to 1879. For the use of Amateurs. By EDWARD CROSSLEY, F.R.A.S., JOSEPH GLEDHILL, F.R.A.S., JAMES M. WILSON, M.A., F.R.A.S. With Illustrations. 8vo. 21s.

44 pages 8vo. 1s.

RRECTIONS, TOGETHER WITH NOTES, CRITICISMS, RECENT MEASURES AND DISCOVERIES, &c., &c., TO THE HANDBOOK OF DOUBLE STARS.

THE BIBLIOGRAPHY HAS ALSO BEEN BROUGHT UP TO DATE.

The volume is one which may be expected to find its way to the shelves of most amateurs and students of astronomy."—*Nature.*

This is a truly delightful work, and one which will admirably supply a want. Into the hands of abler, more impartial and taking observers and compilers than the authors' its preparation could not have fallen."—*The Astronomical Register.*

Will be welcomed by all who take an interest in the subject of double stars."—*Acaaemy.*

The names of the authors, noted authorities on the subject treated of, will lead the reader to open this volume with the feeling in it he has a treasure of lore on the knowledge brought to light in the last hundred years respecting the relative motions of cally connected stars, nor will he be disappointed."—*Athenæum.*

One of the most valuable additions to the library of the amateur astronomer that has been made for many years. It is full of mation of perennial interest to the student and the practical observer, and assuredly ought to be upon the table of every single vatory in the United Kingdom, and of all those in other parts of the world where the language in which it is written is igible."—*The English Mechanic.*

The book is well and clearly printed, and we heartily recommend it to our readers as a most valuable contribution to the ture of double-star astronomy."—*The Observatory.*

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE,

22, ALBEMARLE STREET, LONDON, W.

The NEXT ANNUAL GENERAL MEETING will be held at YORK, commencing on WEDNESDAY, August 31.

PRESIDENT-ELECT.

SIR JOHN LUBBOCK, Bart., M.P., D.C.L., LL.D., F.R.S., F.L.S., F.G.S.

NOTICE TO CONTRIBUTORS OF MEMOIRS.—Authors are reminded that, under an arrangement dating from 1871, the acceptance of Memoirs, and the days on which they are to be read, are now, as far as possible, determined by Organising Committees for the several Sections *before the beginning of the Meeting*. It has therefore become necessary, in order to give an opportunity to the Committees of doing justice to the several Communications, that each Author should prepare beforehand an Abstract of his Memoir, of a length suitable for insertion in the published Transactions of the Association, and the Council request that he will send it, together with the original Memoir, by book-post, on or before August 1, addressed thus:—"General Secretaries, British Association, 22, Albemarle Street, London, W. For Section....." Authors who comply with this request, and whose Papers are accepted, will be furnished *before* the Meeting with printed copies of their Reports or Abstracts. If it should be inconvenient to the Author that his Paper should be read on any particular days, he is requested to send information thereof to the SECRETARIES in a separate note.

Reports on the Progress of Science, and of Researches instructed to individuals or Committees, must be forwarded to the GENERAL SECRETARIES, for presentation to the Organising Committees, accompanied by a statement whether the Author will be present at the Annual Meeting.

No Report, Paper, or Abstract can be inserted in the Reports of the Association unless it is given in before the conclusion of the Meeting.

G. GRIFFITH, Acting Secretary.

ROYAL INSTITUTION OF GREAT BRITAIN,

ALBEMARLE STREET, PICCADILLY, W.

LECTURE ARRANGEMENTS AFTER EASTER, 1881.

Lecture-Hour, 3 o'Clock p.m.

Prof. DEWAR, M.A., F.R.S.—Six Lectures on "The Non-Metallic Elements"; on Tuesdays, April 26 to May 31. One Guinea the Course.

Prof. TYNDALL, D.C.L., F.R.S.—Six Lectures on "Paramagnetism and Diamagnetism;" on Thursdays, April 28 to June 2. One Guinea.

Prof. H. MORLEY.—Three Lectures on "Scotland's Part in English Literature;" on Saturdays, April 30, May 7, 14. One Lecture on "THOMAS CARLYLE;" on Tuesday, June 7. Half-a-Guinea.

E. C. TURNER, Esq., Lector at the University of St. Petersburg.—Five Lectures on "The Great Modern Writers of Russia;" on Saturdays, May 21, 28, June 4. Thursday, June 9, and Saturday, June 11. Half-a-Guinea.

EPITOME OF GARDENIN

By THOMAS MOORE, F.L.S., F.R.H.S.,

Curator of the Botanic Garden, Chelsea.

With an Introductory Chapter on the Principles of Horticulture by MAXWELL T. MASTERS, M.D.,

Illustrated with upwards of Two Hundred Wood Engravings.

Edinburgh: ADAM & CHARLES BLACK.

WESLEY COLLEGE, SHEFFIE

(*Affiliated to the London University*, 1844.)

Governor and Chaplain, Rev. W. H. DALLINGER, F.R.S. Head Master, H. M. SHERA, Esq., M.A

Second Master, R. SHINDLER, Esq., M.A. (Lond.).

And Eighteen Assistant Masters and Professors.

The object aimed at in this Institution is a sound and comprehensive mental training. The course of study is the requirements of the present time and to the prospective wants of the pupils, who, whether in preparation for training for scientific pursuits, or for professional or commercial life, are provided with the most efficient aids.

BIOLOGY, PHYSICS, and CHEMISTRY, the Modern Languages of Europe, Hebrew and Syriac, Vocal Music, and Drawing, are taught by accomplished Professors.

The Rev. W. H. DALLINGER, F.R.S., has undertaken the Professorship of NATURAL SCIENCE, an Lectures and Class Instruction in Practical Zoology, Botany, &c.

Physics and Chemistry are taught by A. H. ALLEN, Esq., F.C.S.

Scholarships are awarded, worth in the aggregate 300*l.* a year.

Prospectuses may be had by application to the GOVERNOR or HEAD MASTER.

With 119 Engravings and 5 Maps of the Stars.

POPULAR ASTRONOMY.

BY

PROFESSOR S. NEWCOMB, LL.D.

8vo, cloth, price 18*s.*

"As affording a thoroughly reliable foundation for more advanced reading, Prof Newcomb's 'Popular Astronomy' is deserving of strong recommendation."—*Nature.*

"When we take up a book written by one of the foremost astronomers, mathematically and practically, of the day, we need not fear that, however popular, it will be inexact in its language or evasive in its descriptions. Nor are we disappointed in the book before us. Throughout the whole of it we are struck by the total absence of the defects so common in popular writings. . . . It is unlike anything else of its kind, and will be of more use in circulating a knowledge of astronomy than nine-tenths of the books which have appeared on this subject of late years."—*Saturday Review.*

THURSDAY, APRIL 14, 1881

THE NEW MUSEUM OF NATURAL HISTORY

THE great terra-cotta building facing Cromwell Road, South Kensington, and occupying the site of the old 1862 Exhibition, about which for the past twelve months public curiosity has been raised, is about to draw up its blinds, and to offer a part of its extensive galleries for inspection on Easter Monday.

It is no secret that for thirty years past the accommodation in the British Museum, Great Russell Street, Bloomsbury, "both for man and beast," had become too restricted, and the necessity for a larger building was keenly felt. As usually happens in such cases, the most adventurous and energetic officer was the first to obtain for his department what he required, namely, *more room*.

Sir A. Panizzi (then Keeper of Printed Books) projected, shortly after the 1851 Exhibition, his scheme for a great central Reading-room and Library, and some five years after witnessed its completion. Some years later on, the Department of Antiquities, represented by Mr. C. T. Newton, C.B., also obtained an addition to its galleries on the western side, and still more recently on the southern side, next the great Entrance Hall.

Great praise is due to Mr. Bond, the present Principal Librarian, for putting an end to the use made of the fine colonnade in front of the British Museum, which for twenty-five years was blocked by antiquities covered in with a row of extremely unsightly and incongruous wood and glass sheds. These are now happily removed. The Department of Prints and Drawings lacking a gallery, obtained possession of the "King's Library" floor on the east side for an exhibition space; and even the conservative Coin Department likewise laid out for the public a few show-cases here of coins and medals.

But, like the clothes of the rising son, in the old caricature, the collections everywhere had outgrown their receptacle, and none more so than the departments of Natural History. Scientific men were however not unanimous, and a fierce controversy was carried on in 1858-59 as to the relative merits of enlargement on the old site, or dismemberment. Finally, after a Committee of the House of Commons had taken evidence upon the subject, the removal of the Natural History Collections was decided upon by Government.

But the death of the Prince Consort, the delay of the House of Commons to vote the necessary funds, the retirement of Sir A. Panizzi from the post of Principal Librarian, the discussion of rival plans, the inevitable delays about the completion of any Government building, caused twenty years to pass before the plans of the chosen architect, Mr. Alfred Waterhouse, were realised in a solid and material form.

Midsummer, 1880, barely sufficed to enable the Office of Works to certify to the fulfilment of the Contractor's work and to hand over the building to the Trustees ere collections began to be moved in.

Nine months only have elapsed, and already three Departments, viz. Botany, Mineralogy, and Geology, have transferred their entire collections from the old to the new building. But less than half the cases for the entire building have yet been supplied, and everywhere the labour of completing the structure as well as fixing cases and fittings is being busily carried on. Under these circumstances it seems not improbable that two years may elapse before the Zoological Collections will be removed and housed in their new quarters.

Let us now take a glance at what Mr. Sala styles "this Temple of Nature." The architectural character of the new building may be termed "Decorated Norman," but it is in many respects unique, especially as regards the treatment of its details. The first, or "ground-floor," is above the road, and the entrance is approached by a broad flight of steps and by a sloping carriage-drive. The entire structure is of brick cased with terra cotta, the doorways and the windows being ornamented with columns designed from natural history objects, chiefly from plants. Reproductions of various animals are also introduced. The main part of the building has a tower at each end, and there are also two central towers rising on either side of the entrance. The south front of the building is about 650 feet in length, running due east and west, and is three storeys high, in addition to the basement, which is above the level of the garden in which the building stands.

The Central Hall or "Index Museum" runs from south to north; it is 150 feet long, 97 feet wide, and about 60 feet high; along its two sides are twelve arched recesses. At the north end is a wide and handsome staircase which branches off right and left to the open corridors or side aisles on either hand upon the first floor. This Central Hall is more richly decorated than any part of the building. The floor of mosaic work, where Italian marble is employed, has been skilfully laid by Italian workmen. The side aisles or corridors look out into the Central Hall by an open balustrade surmounted by large arches, each containing three smaller ones, the centre one being much higher than the others. The pillars supporting these are ornamented with a nearly natural treatment of *Lepidodendron*; in some few cases animals, monkeys, birds, &c., are introduced. The decoration of the ceiling is very effective. A double row of panels runs along the central line, and on either side of this, between the iron girders and following the curve of the roof, are panels in groups of six; these are ornamented with representations of different species of trees, shrubs, and flowering-plants treated somewhat conventionally. That portion of the ceiling over the main body of the hall is decorated with trees, each of which occupies six panels, as they can be most easily seen from the floor and need bold treatment. At the south end, where the ceiling is over a staircase and landing leading from the first to the second floor, each panel contains but one species: the eye being nearer to the ceiling greater detail has been introduced. The effect of the whole is very fine, and as the hall is at present without any cases or specimens, it has the general appearance of a cathedral. This idea is further heightened by the introduction of a triforium, though this has been added merely for effect, the passages being interrupted.

Beyond the Index Museum is a smaller and less lofty hall quite divided from it, save by two arched entrances, 97 feet by 70 feet, intended to hold the British Zoological Collection. It is surrounded by arched recesses similar to those in the Index Museum. In this hall the decora-

tion of the ceiling is also botanical, but all the species selected are of British plants. Underneath the staircases and in the recesses a plain light colour is introduced, relieved with gilding. The decorations of the saloons or galleries are much simpler. The columns throughout are of terra cotta, ornamented with natural history objects.

The other parts of the building consist of series of galleries running north from the front or main building, but only one storey above the basement. The rooms on each floor, at the end of the long front galleries and under the two end towers, are called pavilions. The main or front galleries facing Cromwell Road are lighted by windows north and south. The Central Hall or Index Museum, the Hall for British Zoology, and all the other galleries of one storey high running north, are lighted by skylights. The Index Museum has however, in addition to its roof-lights, windows in the corridors on either side.

The distribution of the space available is as follows:—The long galleries to east of the entrance on the ground-floor, and all the galleries from it, running north, are devoted to Geology and Palæontology. The first floor above the Geological Gallery is devoted to Mineralogy, and the floor above this to Botany. The whole of the galleries on the west side of the building are given to Zoology. The Index Museum, according to Prof. Owen, is designed to present to the public, in a series of twelve recesses, typical examples of all the collections—in fact, an epitome of the whole animal, vegetable, and mineral kingdoms. Prof. Owen further desires to show the marvels of nature and objects of special interest, as exemplifying size, &c., such as whales, basking sharks, &c. These are to occupy the centre of this great hall. Passing to the right from the Index Museum (on the ground floor) we enter the South-East Gallery of the Geological Department (233 feet in length by 50 feet in width, and lighted by windows on either side), at the east end of which is the Pavilion, a room 60 feet by 40 feet. These two galleries are entirely devoted to the exhibition of the fossil Mammalia and Birds, and are provided with pier-cases and table-cases. The larger objects are arranged down the centre of the floor.

The cases on the left hand are nearly all occupied with the remains of *Proboscidea*. Commencing with the *Deinotherium* from Epplesheim, with its tusk-like incisors in the lower jaw, we pass to the *Mastodons*, in which, as a rule, the tusks are developed in the upper jaw and not in the lower. But to this there are exceptions; one American Mastodon having immature tusks in the lower jaw, and the *Mastodon augustidens*, from Sansau in France, having tusks in both the upper and the lower jaw.

Nearest the entrance door, in the centre of the gallery, is placed the entire skeleton of the great American mastodon from Ohio, which must have been considerably larger in bulk than that of any existing elephant; on the same stand is placed the head of a young Mastodon from New Jersey, and in front of it the skull and lower jaw of the South American Mastodon from Chili. It is interesting to notice that both the mastodon and elephant had overspread the North and South American continents in Tertiary times, and they were equally widely distributed over the European and Asiatic continents; their modern representatives however are confined, the one to the continent of Africa, the other to India, Ceylon, &c. The tusks of some of the old fossil elephants were of enorm proportions: witness the head of *Elephas ganesa* from Siwalik Hills, India, and that of the mammoth (*Elep primigenius*) from the valley of the Thames, near Lon Large numbers of elephant remains have been dredg up year by year for the past sixty years off the Dogg Bank and the Norfolk coast, affording good eviden that in comparatively modern times the North Se was a great valley watered by the Rhine, Moselle & giving pasturage to vast herds of deer, bison, oxen, a elephants; where also the rhinoceros and the hip potamus found a pleasant home. A goodly series of remains of these animals from British and Continen localities may be seen in this gallery, and also abundan evidence of the old Siberian mammoth and rhinocer both of which have been met with "in the flesh," frozen solid in mud and ice. Here are also exhibited an in teresting series of the "pigmy elephant" from Ma brought home by Admiral Spratt, R.N., and Prof. Le Adams. By far the larger collection of elephant rema are those from the Siwalik Hills, India, obtained by C Sir Proby T. Cautley and described by Dr. Hugh Falcon F.R.S. The "gigantic Irish deer" (*Megaceros Hiberni* forms a prominent and striking object in the centre of the gallery, with its branching antlers 10 feet across, a ready prey for its contemporary, the "sabre-toothed tiger (*Machairodus latidens*), remains of both animals have been found together in Kent's Cavern, Torquay.

Passing by the cases of carnivora, of thick-skinned animals, and of ruminants, our attention is next arrested by the great bandless armadillo from South Americ (*Glyptodon*), whose carapace is bigger than a hogshe and which measured nearly 12 feet from its head to the tip of its armour-plated tail.

Another of these extinct Edentates from the La Plat the *Megatherium Americanum*, stands in the centre of the floor of the Pavilion. This colossal "ground-sloth measured 18 feet in length, its bones being more massive than those of an elephant. It displays in every part of its framework enormous strength and weight combined sufficient to break down or uproot the trees, upon the leaves and succulent branches of which it fed, like its pigmy modern congener *Bradypus tridactylus*, which leads an arboreal existence, climbing from bough to bough in the Brazilian forests.

The extinct Marsupial fauna of the great island conti nent of Australia is here well represented by the hu *Diprotodon*, the *Nototherium*, and the anomalous *Thy coleo*. Of the Wombat family only a small living repre sentative is known, of burrowing habits, found in Tas mania; formerly they were abundant on the contine of Australia, varying in size from a marmot to that of tapir. The largest of these are called *Phascolo magnus* and *P. gigas*.

The collection of remains of the great extinct wingless birds of New Zealand forms a very interesting feature this gallery. The tallest skeleton measures 12 feet in height, and the smallest not more than 3 feet.

Madagascar had also its extinct wingless birds, simi to those of New Zealand. Eggs of both the *Dinor* and the *Æpyornis* may here be seen, one of the latter having a capacity of two gallons.

The rarest of all avian fossils is still the *Archæop*

have representatives of

both the marine turtles, the fresh-water *Trionyx* and *Emys*, and the gigantic and lesser land-tortoises. Of the first of these are the remains of the great *Chelone Hoffmanni* from Maestricht, and the *Chelone gigas* from the London Clay of Sheppey, larger by far than the "logger-head" turtle of the present day. Of the last (land-tortoises) may be mentioned the *Colossochelys atlas* from the Siwalik Hills, which out-rivals the *Glyptodon* in bulk.

Three wide and four narrow galleries built at right angles to the Reptile Gallery, each 137 feet in length, the former being 40 feet and the latter 20 feet in width, are placed alternately, running due north and south, and lighted from above. These fine rooms afford ample accommodation for the fossil fishes, all the classes of the Invertebrata (mollusca, brachiopoda, bryozoa, insecta, myriopoda, arachnida, crustacea, annelida, echinoder-mata, corals, foraminifera, sponges, and plants). These long galleries, or annexes, and the ones corresponding with them on the western side, are built upon the plan recommended by the Royal Commission of 1874. But the wall-cases are all constructed to open in front, *not at the back* of the case, as suggested. They are however the best-lighted galleries in the whole building, and best suited for museum purposes. Two of these large gal-leries are not yet ready for occupation, and the third is under arrangement; the narrow galleries give space for a library, special reference collections, a stratigraphical series, and working-rooms for students.

In the basement are twelve workshops, studies, and store-rooms devoted to Geology, ten studies, work-rooms, and laboratories to Mineralogy, and three to Botany.

The Mineralogical Gallery, on the first floor, which corresponds with the South-East Gallery and Pavilion in extent, is also lighted by windows on either hand; it has seven wall-cases, two at each end of the long gallery and three in the Pavilion, the collection being mainly contained in forty-eight large table-cases.

These table-cases form a long row on either hand, com-mencing at the entrance of the gallery, the odd numbers being on the left hand and the even on the right. Each of the first forty cases nearly equals in capacity two of the cases in the old mineral gallery; we have therefore a much more magnificent display than could have been attempted formerly, when the minerals and fossils were all crowded together in the same gallery.

The collections of naturally and artificially-prepared crystals occupy two large cases in the Pavilion, whilst two of similar construction are filled with meteorites. The great Cranbourne Meteorite and that from Mexico occupy special cases on the east side. In the wall-cases are arranged the extensive collection of rocks, two cases being devoted to polished marbles.

The general plan pursued in the arrangement remains the same as in the old Museum gallery, so that by using boxes corresponding to one quarter of a table-case, the minerals were transported from the old to the new build-ing and re-arranged in an incredibly short space of time, and with the exception of the Pavilion and the wall-cases have long been ready for exhibition.

In the Botanical Gallery the glazed cases for the exhi-bition of specimens project from the wall into the room like square shop-fronts, having three plate-glass sides. The whole of the glass is permanently fixed, except one

division forming the door. A "cell" inside, inclosed by curtains, gives access to the specimens; by this contrivance it is hoped that the dust will be excluded to a great extent.

Accommodation for large specimens, as, for example, portions of stems and sections of various kinds of wood, such as oak, walnut, pine, cedar, and other dicotyledons, and trunks of palms, cycads, tree-ferns, bamboos, and other striking examples of the vegetable kingdom, is provided for by three tall metal and glass cases 14 feet high, occupying the floor-space in the centre of the gallery.

One-half of the main gallery is partitioned off from the public room, and fitted up with cabinets for the reception of the *Herbarium*, the nucleus of which was obtained by Sir Joseph Banks and Solander in their voyage round the world with Captain Cook. This first series of cabinets is entirely occupied with the flowering plants, which are all fastened on single sheets of paper. The Pavilion contains similar cabinets for the reception of the British plants and Filicinæ, whilst the room above in the tower is intended for the Cryptogamia. Down the centre of the large room are cabinets fitted to receive the great collection of fruits and seeds, each being placed near its appropriate family in the Herbarium on either side. These inner rooms, with the valuable library attached to them, are of course only available for purposes of study, but are always accessible to the botanical student and worker.

On the south-west side of the Index Museum, the gallery on the second floor which corresponds with that appropriated to Botany is designed to contain the great collection of Recent Osteology; that on the first floor is to be devoted to stuffed animals, and the front ground-floor gallery to birds. The eight galleries in rear of the main building on the west side will be appropriated to the Reptilia, Fishes, and Invertebrata. The collections preserved in spirits are to be placed in a special building at the north end of these galleries. The basement on the west side contains sixteen studies and work-rooms and a large open space well fitted for workshops and stores.

The Assistant-Secretary (Mr. J. T. Taylor) is provided with offices adjoining the Board Room on the first floor above the British Zoological Hall. The Superintendent, Prof. Owen, C.B., and the Keepers of Geology (Dr. H. Woodward, F.R.S.), of Mineralogy (Mr. L. Fletcher, M.A., F.G.S.), and of Botany (Mr. W. Carruthers, F.R.S.), have each a study in the central towers on either side the entrance.

There are a few scientific men who still strongly protest against the removal of the Natural History Collections from the old to the new building, on the ground that the locality is inconveniently far west, and that they are thereby precluded from using the Collections so freely as heretofore. One of the strong grounds for protesting against the removal has been the serious inconvenience arising from the separation of the collections from the great National Library. This injury will however be gradually removed by the formation of a new Natural History Library in the present building, a vote for which has been already taken.

The comparatively small band of scientific men who use the Natural History Museum for purposes of special work and study, would always do so wherever the collections happened to be located.

So too the holiday-makers, who come to the Mus merely to be amused, will as willingly travel to S Kensington as to the Regent's Park Zoological Gard or to the Crystal Palace.

Undoubtedly the highest aim and use of our n National Natural Historical Collections should b impart instruction to the young and rising genera and afford every facility for the advancement of scientific students, and the question whether they are conveniently placed is mainly for them to answer. the future South Kensington is to become a great ce of scientific instruction, then, and not otherwise. Natural History Collections have been placed in th most suitable position.

We cannot conclude this hasty notice without say that the old restrictions as to days of admission hav been swept away, and the collections will from and a the 18th be open daily to the public, save on Sun Christmas Day, and Good Friday, and other public days, &c.; good and cheap guide-books are also t ready for the 18th.

For this and other concessions the public are m indebted to the untiring energy and determination of present principal Librarian, Mr. Edward A. Bond, C who has also been the means of introducing many nec sary and useful reforms into the old building; not the le being the electric light, which it may be hoped will ex cast its beams over the collections in the Natural His Museum, Cromwell Road, South Kensington.

TEXT-BOOK OF MECHANICS

A Text-Book of Elementary Mechanics, for the Colleges and Schools. By Edward S. Dana, Assis Professor of Natural Philosophy in Yale College. (N York: John Wiley and Sons, 1881.)

THIS is a small-sized book of 290 pages printed fairly clear type, and bound in an unpleas looking cover, and we learn from the preface that has been prepared to meet the special wants of Yale College instruction. An endeavour has been mad dwell more fully than usual on the principles of the s ject, at the same time illustrating these principles in practical bearings by descriptions of various machi and appliances, while no mathematical knowledge beyo the rudiments of algebra and trigonometry is requi From this it may be presumed that the book is intend for a very elementary class of students, at a lower st if possible, than "Poll" men at Cambridge, or else it aims at assisting self-education by supplying the pl of a tutor. An undoubtedly good feature in the boo the collection of examples, some of which are interspers in the text, and others collected in a body at the e where the answers are given. The metrical and order units are both employed. These examples are perha the only part of the book which would be of any value teachers in this country. With regard to the su subject-matter of the book, Dynamics is placed first, a Statics follows, with a chapter on the Pendulum at t end. The definitions and the explanation of the pr ciples of the subj[illegible] aiming at fulness and cle ness, are not alw[illegible]ory as might be wish A tendency to lo[illegible]on sometimes caus

balances the value of the fuller explanation. To explain *solidity* we are told that "A solid is characterised by a greater or less degree of rigidity," which in the absence of a separate definition of rigidity leaves us much where we were before. Again, the definition of a *liquid* is this, "A liquid is characterised by its mobility; the molecules are free to move about each other, and the liquid takes the shape of any containing vessel," which is equally true of a *gas*. The proof of the formula $S = \frac{1}{2}ft^2$ is clenched by the proposition that "when two sets of variable quantities, which are always equal, simultaneously approach their limits, these limits are equal," which is suddenly introduced without any explanation of its meaning. This, in a book intended for beginners unacquainted with the idea of a "limit," would be likely to cause some bewilderment. There is a chapter devoted to Work and Energy, as should be the case with all text-books of mechanics nowadays.

In the dynamical section there is an entire omission of "Sliding in Chords of a Vertical Circle" and the pretty problems connected with it. In the statics there is no mention of the stability or instability of equilibrium of one curved surface rolling on another. The micrometer screw surprises us by appearing with the mechanical powers alongside of the wheel and axle and differential screw.

As the compiler has not acknowledged his indebtedness to other works, it is difficult to say how much of this book is original. But we seem to catch echoes of Ganot's "Physics" and of Goodeve's two text-books on Mechanics and Mechanism here and there. For instance, Articles 7, 8, 107, 111 remind one of Ganot, Articles 197, 207, 209, 239 of Goodeve. The woodcuts, some of which are good, and others (*e.g.* those in the chapter on Centre of Gravity) very indifferent, are 190 in number. Some of them are apparently reproductions of woodcuts in English books. We instance Figs. 44 and 175, which are strikingly like Figs. 365 [Joule's apparatus] and 19 [block and tackle] in the eighth edition of Ganot's Physics, translated by Atkinson, and Figs. 142*a*, 150, 152, 155 (in Dana), which bear a very close resemblance to Figs. 49, 58, 110, 113 respectively in Goodeve's "Principles of Mechanics," second edition, Fig. 117 in the latter having apparently supplied Dana's three figures, 162, 163, 164 [on Pulleys]. Fig. 145 in Goodeve's "Elements of Mechanism," fifth edition, may well have been the original of Dana's Fig. 156.

It would have been graceful in the compiler of this work to have expressed his acknowledgments to the two excellent little text-books of Goodeve. On the whole, with the reserve above made in favour of the "examples," we think that neither English teachers nor English students will be the losers if they continue to use already existing English text-books of Mechanics, and leave this American competitor to find an audience on the other side of the water.

CONSCIOUS MATTER

Conscious Matter; or, The Physical and the Psychical Universally in Causal Connection. By Stewart Duncan. (London: David Bogue, 1881.)

AS the title of this little work sufficiently indicates, the aim of its writer is to furnish a scientific basis for the theory of materialism in the region of mind. It is doubtful whether at this time of day anything very original can be said upon this topic, but Mr. Duncan has succeeded in placing some of the facts in a stronger light than previous writers. The facts to which we allude are those which he calls the "analogies" between forces and feelings. Up to a certain point it is by every one recognised that there is some quantitative relation between neurosis and psychosis; mental processes are universally known to entail wear and tear of cerebral substance. Mr. Stewart Duncan traces this quantitative relation as much into detail as he can, by setting forth in a series of twelve "analogies" the resemblances between forces and feelings. These "analogies" are far from being unopen to criticism severally; but here we shall merely mention what they are, as there is more important criticism to apply to them collectively. The analogies are that feeling and force are each without extension, both related to matter, have "plurality predicable of them as respects their locality," are diverse, have time-extension or duration, also the quality of degree and capability of being compounded or combined, are respectively transmutable *inter se*, &c. Doubtless, as Mr. Duncan observes, such analogies, or, as we should prefer to call them, parallelisms, might be largely multiplied; but what would any number of such parallelisms prove? Not, surely, what Mr. Duncan desires them to prove, viz. that forces stand to feelings in the relation of causes to effects. So far as the tracing of such mere parallelisms is concerned, we might almost as reasonably conclude the recent earthquake at Chio to have been the cause of this review, in that they each possess extension, have diverse parts, and so on. In order to establish a relation of causality we should require to show that the observed parallelism is due to that relation; we cannot argue from the observed parallelism as itself sufficient proof of such relation. Were this not so, there would be no need for Mr. Duncan or any one else to write a book on "The Physical and Psychical Universally in Causal Connection"; for as the fact of a constant parallelism between neural processes and mental processes is now no longer an open question, were mere parallelism sufficient to establish proof of causality, materialism would now be a demonstrated theory.

It is needless here to go into the whole question as to the relation of body and mind, or to point out all the shortcomings of materialism as a philosophical theory. But it is a defect in Mr. Duncan's work that he does not attempt to meet some of the most formidable of the difficulties with which this theory is beset. Thus he does not consider the fact that what we know as matter and force we know only as affections of mind, and therefore that in all speculations upon the nature and potentialities of the former, we already by implication have necessarily assumed priority of the latter. Nor does he seek to explain the apparent want of equivalency between supposed physical antecedents and supposed mental consequents—why it is that the brain of a Newton required less nourishment than that of an elephant. Lastly, the greatest of all the difficulties is not adequately treated—that, namely, which is connected with the doctrine of the conservation of energy. Are we or are we not to suppose that thought has a mechanical equivalent? If materialists say that we are, then thought itself becomes a mode of

energy, or rather energy by becoming thought ceases to be energy—is destroyed as energy; and so this answer would militate against the doctrine in question. If, on the other hand, it is said that thought has no mechanical equivalent, and yet that energy causes thought, the statement is still in conflict with the doctrine of conservation, because it supposes that energy in the brain differs from energy everywhere else in producing more than its equivalent measure of result. How then under any view are we to conceive of thought as an *effect* of energy? By no stretch of imagination can we attain to the idea of a motor becoming a motive; and if we could attain to such an idea, it would seem to be at the cost of upsetting the most fundamental doctrine of modern physics. And let it be observed in this connection that Mr. Duncan is not very accurate in the statement of his first "analogy," where he says that "Feeling and Force are alike in being both destitute of space-extension." Force in activity is only known as motion in space, while Feeling in activity cannot be conceived as here or there; the conception of Force without any actual or potential relation to space is as impossible as the conception of Feeling in such a relation.

Mr. Duncan's book, however, is worthy of the attention of psychologists, because although we think his attempt to prove a causal relation between physics and psychics a necessary failure, his work is interesting and suggestive if viewed from the standpoint of Clifford's doctrine of "Mind-stuff." If we suppose that Force and Feeling are everywhere one, and so that "all the universe is made up of Mind-stuff," we have a logically possible theory which does not labour under any of the logical disadvantages attending the theory of causality proceeding from matter in motion to mind, or *vice versâ*. Some passages in Mr. Duncan's work seem to show that he has very nearly entered this conception himself; and we therefore feel that he would have written a more valuable treatise if, going a little further, he had discarded the obsolete attempt to explain parallelisms by an impossible theory of *causality*, and undertaken to argue that these parallelisms are really due to a fundamental *identity*, which, as Lewes puts it, is phenomenally diverse only in relation to our modes of apprehension.

Winter Gnats (Trichocera)

THE winter gnat (*Trichocera hiemalis*, D. G.) subjects of phenological observations undertaken l rological Society. Its appearance directly after l frost, often whilst the thaw is in progress, has entomologists to inquire whether the insects then s hybernating during the cold weather, or have n from the pupa. No evidence has been adduced either alternative. Some facts concerning the ha noted as opportunity occurred during the last two upon the matter in question, and may therefore be both the above classes of your readers. The na *hiemalis* is used here in its meteorological sens would pretend to distinguish this abundant species from the common *T. rufescens*.

With a view to learning what becomes of the winter gnats ring inclement weather I frequently jotted down, when the es were upon the wing, the temperature of the air in the places their resort, the time of the day, and any peculiarity notice-le in the flight of the insects. Upon other occasions, at cor-sponding periods of the day, when the weather was colder and gnats could be seen anywhere, I made similar entries of the mperature prevailing in their usual playgrounds. The instru-ent employed was a Casella's pocket-thermometer mounted in bonite, graduated upon the stem at intervals of every two egrees, and duly compared with a standard.

From the notes thus obtained, which need not be quoted in etail, it appears that the flight of *Trichocera* varies in style ith the temperature, and, as a general rule, is altogether dis-ontinued when the cold exceeds 36° F. Once indeed I saw a nat flying when the thermometer stood at 34°·5 F., but there as reason for suspecting that it had just been startled out of the edge by a passing carriage. When such low readings as these re obtained the insects do not congregate, but fly singly with a eavy drowsy flight, as though impelled by business rather than leasure; and very few venture to show themselves upon the ing at all. At temperatures of 38° to 42° F. they may be seen ccasionally flying steadily in places sheltered from wind; and when a warmth of 45° F., or more, is attained, they throng together and dance for joy. These particulars, by the way, need not prompt meteorologists to do something with their phenolo-gical tables by entering in them "*Trichocera* flying" every calm winter's afternoon if the temperature exceeds 40° F., with-out troubling themselves to go out of doors and look after the gnats.

It was some time before I succeeded in tracing *Trichocera* to the places where it seeks repose after its gambols and whiles away periods of weather too cold or boisterous for excursions abroad. The flies may be seen sometimes at rest upon fences, with their legs stretched out flat, and it appeared probable that they took refuge in the hedges somewhere. A very favourite harbourage of theirs however seems to be the under side of boards and stones frequented by woodlice and earthworms They stand back downwards on the wood or stone, not upon the earth below; and although the specimens found in such situations are mostly females who have gone there to lay eggs, I have once or twice noticed males taking shelter in similar places. Beneath a single flower-pot saucer standing upon damp earth, and eight inches across the bottom, I have counted as many as ten females at once; an individual gnat dislodged crept back underneath it again; but the site became dry, and they forsook it. The wonder was how they managed to enter so shallow a crevice in the first instance. The haunts of the isopod, *Trichoniscus pusillus*, are not too damp for them; but in frosty weather they are apt to take shelter under any dry pieces of wood lying loosely upon the ground. It is obvious that flies with such habits as these cannot fail to be snowed up in great numbers at the first fall; and when the frost is over, having been securely protected from extreme cold, they are ready to take wing again as soon as the snow has melted sufficiently to admit of their creeping forth. Hence, though the temperature may be relatively mild directly after a snowstorm, no gnats are likely to be seen flying until the snow has largely disappeared, when *Trichocera* will become common. Similarly after frost without snow, when the thaw sets in the flies will probably not issue from their retirement immediately, but will rest quietly until the change of temperature has had time to reach them in their lurking-places, whatever may be the warmth of the outer air meanwhile. Perhaps this is the cause of so few winter gnats being seen in the mornings early in the year; but whether it be r not, the other foregoing surmises harmonise well with my vations.

imum of cold to which winter gnats can be exposed consequences has not yet been ascertained.

oad, Croydon, April A. E. EATON

ustralian Plants in India

xiii. p. 370, some remarks are made (with llace's observations in "Island Life") nability of Australian plants to become rn hemisphere. It may therefore be r. Wallace to learn of some striking case of Australian plants which Nilgiri plateau in Southern India, at elevations ranging from about 5500 to nearly 8000 feet above sea-level. Acacias and Eucalypti in particular have found a congenial home in this region, and visitors from Australia who have seen them say that they appear even more vigorous than in their native soil. Hundreds of acres of *Eucalyptus Globulus* and of *Acacia melanoxylon* and *A. dealbata* have been planted by Government as firewood reserves, and the trees have grown up splendidly. The only drawback to the success of the experiment has been that the *Acacia melanoxylon* has been greatly injured by Loranthaceous parasites. In fact this species will apparently in course of time be exterminated by these indigenous pests. Besides *Eucalyptus Globulus* the following species of the genus have also been introduced, and thrive well:—*E. sideroxylon*, *E. obliqua*, *E. fissilis*, *E. rostrata*, *E. viminalis*, *E. amygdalina*, and *E. perfoliata*. In addition to the two species of *Acacia* already mentioned, the following have also been added to the list of healthy growing exotics on the Nilgiris, viz. *A. pycnantha*, *A. salicina*, *A. longifolia*, *A. decurrens*, *A. cultriformis*, *A. elata*, and others, might also be enumerated. As regards other Australian plants on these hills we have *Hakea*, *Banksia*, *Myoporum*, *Kunzea*, *Tristania*, *Pittosporum*, *Beaufortia*, &c. In short there is a very considerable Australian flora flourishing on the "Blue Mountains" of Madras, and so extensively have the trees been planted out about the principal stations that they have given quite a new character to the scenery. Some of the acacias have a considerable resemblance in shape and colour to the Scotch fir, and this likeness has, to some visitors, added a fresh charm to the beauties of the scenery. G. BIDIE

Madras, March 15

The Tide Predicter

WITH regard to the letter of Sir William Thomson in NATURE, vol. xxiii. p. 482, respecting the above instrument, I may say that the Tide Predicter which I have planned and designed for the prediction of Indian tides owes its development, not to the British Association Tide Predicter, but to a complete two-component working model made by me in the spring of 1873. This model was made before the British Association instrument was designed.

It was on the express recommendation of the Surveyor-General and Superintendent of the Great Trigonometrical Survey of India that I was invited to plan and undertake the construction of the instrument, and I was left absolutely unfettered in my choice of mechanicians to carry out the work. My connection with the instrument is clearly explained in the official prefaces to the Tide Tables for Indian Ports, 1881, published by authority of the Secretary of State for India in Council. I may point out that my paper upon this instrument (*Proceedings* Roy. Soc., No. 197, 1879) was written at the desire of Sir William Thomson, to whom it was first submitted, and by whom it was entirely approved and originally communicated. He was also present at the meeting of the Royal Society when the paper was read, and never expressed the least objection to any of its contents. In that paper credit is given to him for the improved slide, which he, with Prof. James Thomson's assistance, had devised for an harmonic analyser, and also to Mr. A. Légé for the admirable plan of the wheel-gearing. EDWARD ROBERTS

"The Oldest Picture in the World"

IN Mr. Loftie's "Ride in Egypt" is a woodcut (p. 209) of what is called "the oldest picture in the world," a fresco from a tomb at Maydoom, now in the museum at Boolak, wherein are represented six "pasturing geese." Two of these are undoubtedly *Anser albifrons*, two, probably *A. ferus* or *A. segetum*, and the other two seem to be the rare *A. ruficollis*, from Northern Asia. I should be greatly obliged to any one who would let me see a *coloured* copy of this picture, that I might be assured as to my determination of the figures. Mr. Dresser, in his excellent "Birds of Europe," mentions his having received a specimen of *A. ruficollis* sent him from Alexandria by the late Mr. Stafford Allen. Otherwise its appearance in Egypt seems to have been hitherto unrecorded. ALFRED NEWTON

Magdalene College, Cambridge, April 10

Probably New Variable Star

ON January 22, 1879, I observed near O^2 Canis, a very remarkable double star, with one component a fiery red 8·5

magnitude, and the other a blue 9. The contrast of colours was very striking, but there was little difference in size. In a letter recently received from the Rev. Mr. Webb, I find that it was previously observed by him, and it appears as one of his own discoveries in the second edition of "Celestial Objects," published in 1868. The red star is there classed as 6·5 mag., and the blue as 8. The two stars, therefore, appeared to differ very considerably in magnitude when seen by Mr. Webb, while to me, eleven years subsequently, they seemed quite nearly equal. Hence I conclude that the red is a variable, and I wish to call the attention of observers to it while it still remains in view. By a rough measurement I make out its position for 1881 = α 7h. 10m. 44s., and δ − 23° 6′·6. JOHN BIRMINGHAM.

Millbrook, Tuam, April 9

Concealed Bridging Convolutions in a Human Brain

IN his work on the "Convolutions of the Human Brain" Ecker denies explicitly that the first and second external bridging convolutions of Gratiolet, as seen in Cercopithecus, Inuus, &c., are ever concealed, either in the higher apes or in fœtal or adult man. I have however in my possession an adult human brain in which *a* convolution nearly corresponding in position to the external bridging one of Gratiolet is concealed, while another slightly external to it is nearly so. The brain was hardened in nitric acid with the membranes on (a much preferable method, by the by, to that of first removing the membranes; as these, by absorbing the acid and swelling, serve, like so many wedges, to keep the convolutions apart, and prevent the shrinkage that otherwise takes place). There was no indication of any concealed convolution until the membranes, just moistened for the purpose with water, were being removed. Then, owing to the opening out of the sulcus occipitalis transversus of Ecker, the tip of one became visible, and this tip, even now that the edges of the sulcus are widely separated, is from one-eighth to one-sixth of an inch beneath the general surface.

Its position relative to the great longitudinal fissure and to the posterior border of the gyrus supramarginalis seems to me pretty accurately to correspond to that of the external bridging convolution to those parts in the brain of an Indian pig-tailed baboon of undetermined species with which I have compared it; but in the latter the sulcus occipitalis transversus does not exist, while in this human brain, as is very common, the lateral or horizontal portion of the fissura parieto occipitalis, beneath the bevelled edge of which in the baboon the convolution lies concealed, has a very short course indeed.

The only difference then is that in the one specimen (the human) the concealed convolution lies in the transverse occipital fissure, there being no lateral extension of the parieto-occipital fissure, while in the other it lies in the parieto-occipital fissure, the transverse fissure not existing WILLIAM CARTER

Liverpool, March 26

Sound of the Aurora

IF I had consulted Franklin's account of his Polar researches before I sent you my extract from Tacitus, I should not have revived the question of sounds being heard with the aurora borealis. Franklin and his companions watched the aurora 343 times in two successive winter seasons; and never once, he says, did they observe a sound. Were, then, the experiences quoted by your other correspondent and myself mere illusions? Perhaps not. Franklin made his observations at and about the southern shore of Bear Lake, in latitudes varying from 67° to 69° north; might not the greater volume of air through which the phenomenon had to pass in reaching our island have caused the electric fluid to work up a sound? Surely that is possible. The attractive force of the aurora is—we learn from Franklin himself—increased within a certain limit as its rays proceed southwards; for whereas Parry and his party at Port Bowen in latitude 73° 15′ noticed no deflection of the compass-needle under the influence of coruscations, Franklin and his party on the shores of the Bear Lake, six degrees further south, constantly observed this effect. And the attractive force is strongly felt here—hindering telegraphic communication at all events. Might not the vibratory force not sensible at within so short a distance from its origin as the attraction be increased within a greater limit? M. L. ROUSE

Sunnymead, Chislehurst Common

PERIODIC OSCILLATIONS OF BAROMET PRESSURE

THE MSS. of the accompanying article, which left unfinished by the late Mr. John Allan B F.R.S., were handed over to me some time ago by Balfour Stewart, with a request that I would put into shape for publication.

I have not found it necessary to make many alter in, or additions to the original, and where made the mostly indicated in initialed foot-notes.

E. DOUGLAS ARCHIBA

In an article which appeared in NATURE (vol. xx a remarkable relation was shown to exist betwee annual ranges of the atmospheric pressure and t temperature of the air, as derived from the mon means obtained from several years' observations o barometer and thermometer at certain stations n The results and the conclusions from them do not ap to have been always understood, and as they bea some of the most interesting questions on meteor I shall now examine them anew with the aid of ot vations at some other stations, under different conditions.

For this end it is desirable to employ some elemen considerations. Let us, first of all, consider the e of varying temperature on a vertical column of the atmosphere. Let us consider a column of air reaching from the soil at B to the upper limit of the atmosphere at A; and suppose that the pressure shown by a barometer at B is 30 inches, while at a higher station, C, it is only 20 inches. If, now, the column of air is heated so that the temperature of the part B C is increased by 10° F. we know from laboratory experiments that the air will expand, so that a part of that which was below C will be pushed above it, and while the barometer at B will continue to show 30 inches, that at C will show 20·2 inches, the mercury at C will have risen two-tenths of an inch.

If, now, we suppose that the mass of air remains constant throughout the year, there will be an annual variation of the barometer at C, where its height will be greatest in the warmest month and lowest in the coldest month. For the same reason the difference of the barometric heights at B and C will be least in the warmest mo and greatest in the coldest.

It has been supposed that the mass of the atmosp remains constant throughout the year; if this is not case the variations of pressure at C will not depend temperature alone, but also on the other causes wh produce variations at B.

In NATURE, vol. xx. p. 55, Mr. Douglas Archibald h given a series of differences of barometric heights at hig and low stations in India for the months from October April. The month of lowest mean temperature, January shows always, as in the case just supposed, the greate difference of pressures. As the high and low station never in the same vertical, the one being sometimes fi miles horizontally distant from the other, it is difficult eliminate the part of the variation due to temperature the higher station, but if we take as an approximation however rude, the mean of the temperatures at the s stations as that of the vertical column, we can see that considerable part of the variation at the upper stati may be due to the expansion of the column with t perature.

Thus for Leh and Lahore the mean temperatures a difference of barometric heights are[1]:—

[1] The numbers are taken from the work cited by Mr. Archibald Indian Meteorologist's *Vade Mecum*," by Mr. H. F. Blanford, F.R.S. 176, 178.

	Mean temp.	Diff. of Pressures.
	°	in.
January	35·0 Fahr.	... 9·690
July	74·1 ,,	... 9·105

Now as the difference of the mean temperature of these two months is nearly 40°, according to what has been said before, the expansion of the air from January to July should have increased the pressure at the upper station by about 0·8 inch (eight-tenths of an inch of mercury) and have diminished the difference of pressures by that amount. The observed diminution is, however, less than 0·6 inch, a deficiency of two-tenths, which has to be accounted for in some other way.

In the case of the annual variation of atmospheric pressure near the sea-level, we have to consider only the atmosphere above the station; but in that for a high station we have a much more complicated problem in which the atmosphere below the station plays an important part, a part also which may vary greatly, according as the upper station is on a mountain top, on a gradually ascending height, or on high table land.

It was for these reasons that in the article (NATURE, vol. xix. p. 6) under consideration, nothing was said of the annual variation on mountains or at great heights; the results were obtained from observations at stations little above the sea level, and from them it appeared that for every degree Fahrenheit on the range of monthly mean temperature, there was a variation of from ·021 inch at Singapore, to ·025 inch at Bombay and Madras, in the range of the monthly mean barometric height; while at Pekin the amount was diminished to ·015 inch. The conclusion that this ratio was nearly constant in India referred necessarily to stations under similar conditions. Mr. Archibald's letter has brought to notice a series of Indian observations made at stations farther from the sea and in North India, which are given in an interesting and useful work by Mr. H. F. Blanford, Meteorological Reporter to the Government of India, and which merit consideration. The means employed by me previously were derived from observations at standard observatories during five to twenty-six years; and it was mentioned that, as single years gave somewhat variable results, the monthly means from several years' observations were necessary for accurate values. In the cases to be found in Mr. Blanford's work, several are of observations during only two years (or even less), and we have no exact idea of the weight which in any case can be accorded to the observations at the stations. As, however, the results for different stations in general confirm each other (the exceptional cases will be noticed apart), I shall here form a series of groups of stations, each group under nearly the same local conditions as regards latitude, height above, and distance from, the sea. The value of k, the variation in thousandths of an inch, of pressure-range for 1° F. of the temperature-range, is the same for all stations in each group, with the exceptions referred to below.

Thus the most northerly group near latitude 30° N. and 600 miles from the sea, viz., Lahore, Delhi, Dera Ismail Khan, Mooltan, and Roorkee, gives the following result :—

Mean latitude of group (λ).	Mean height above the sea (h).	Mean annual temperature (t).	Mean ranges of temperature and pressure		Mean barometric oscillation for 1° Fahr. $\left(k=\frac{\Delta\phi}{\Delta t}\right)$.
			Δt.	$\Delta\phi$	
°	feet.	°	°	inch.	
30½	660	75·2	39·0	0·620	0·016

This group extends about 450 miles from Delhi to Dera Ismail Khan, and the heights vary from 440 to 890 feet. The value of k is the some for each station.

The next group comprises Bareilly, Lucknow, Jhansi, and Benares, for which the following are the values of the different elements :—

λ	h	t	Δt	$\Delta\phi$	k
	feet.			in.	
26	520	77·7	32·4	0·554	0·017

The distance of the extreme stations is not 300 miles; the heights vary from 270 feet at Benares to 860 feet at Jhansi. For each station k = 0·017.[1]

The third group includes Patua and Gya, and the values are—

λ	h	t	Δt	$\Delta\phi$	k
	feet.			in.	
25½	260	78·5	28·0	0·537	0·019

The distance between the two stations is about 70 miles; the heights are 179 and 347 feet respectively, and the values of k are within half a thousandth of each other.

The fourth group includes Berhampore, Burdwan, Dacca, Goalpara, Chittagong, Calcutta, and Saugor Island, for which the values are—

λ	h	t	Δt	$\Delta\phi$	k
	feet.			in.	
23½	100	78·0	18·7	0·471	0·025

With the exception of Goalpara and Chittagong, these stations all lie in the Gangetic delta, at nearly the same elevation, and with an extreme variation in the value of k amounting to 0·004 inch.[2]

The fifth group includes Bombay alone, the values for which are—

λ	h	t	Δt	$\Delta\phi$	k
	feet.			in.	
18½	37	78·8	11·6	0·287	0·024

The sixth, Madras, Negapatam, Trichinopoly, and Madura, with the values—

λ	h	t	Δt	$\Delta\phi$	k
	feet.			in.	
11½	190	81·7	11·1	0·243	0·021

The seventh, Colombo, with the values—

λ	h	t	Δt	$\Delta\phi$	k
	feet.			in.	
6½	42	81·3	3·6	0·069	0·019

It will be seen from this table that the value of k is a maximum (= 0·025) nearly under the tropic of Cancer, that it diminishes thence both north and south. This diminution cannot, however, be attributed altogether at least to the latitude, since the value is nearly the same at Pekin and at Delhi.

The variation of the value in Northern India from the maximum near Calcutta has an apparent relation to the height above the sea and the distance from it,[3] as well as to the amount of the temperature oscillation; the value of k diminishing as the others increase. We cannot, however, relate the value to any one of the other variables. No doubt height above the sea may have some influence, as has already been shown, but here mountain stations have been avoided; and while in the Lahore group the heights vary from 420 feet (Mooltan) to 890 feet (Roorkee), the value of k remains constant.

It should be observed that the temperature ranges are those of the stratum of air a few feet above the soil, while the ranges of pressure include the whole atmosphere above each station. We see that the value of k dimi-

[1] There appears to be some difference in the values of $\Delta\phi$ as got by Mr. Broun and those derived from my edition of the "Vade Mecum" for these two groups. Thus from my edition (1877), the value of $\Delta\phi$ for Group I. is 0·614, and therefore k = 0·015; there are also slight differences in the value of k at each station. In Group II. k is 0·017 only for Bareilly and Lucknow, the value for Jhansi and Benares being 0·016.—R. D. A.

[2] The figures for the fourth group have been supplied, and the fifth, sixth, and seventh groups have been added as the text seemed to imply their intended formation by the author.—E. D. A.

[3] Mr. Archibald has considered height not to be an element, and he cites in evidence Lucknow and Sibsagar, very nearly at the same height; the former having k = 0·017 and the latter k = 0·028 (NATURE, vol. xx., footnote p. 54). The latter value, however, is a mistake, for at Sibsagar k = 0·018, very nearly as at Lucknow. Mr. Archibald's conclusion is that it is not height, but distance from the sea, as the stations are at widely different distances from the sea. We should, owing to this error, be obliged to reverse the conclusion, and say it is not distance from the sea, but height, that is in question; but, in reality, Sibsagar though not so far from the sea, is still as far as Patua or Gya, with nearly the same value of k.

[See my note on this point, NATURE, vol. xxi. p. 131.—E. D. A.]

nishes as the range of the surface-temperature increases, and it is certain that the ranges of the temperature at all the stations as we ascend above *the soil*, will approach always nearer to each other the higher we go; so that if we knew in what way the relation between the oscillations is produced, and thence, in all probability, the part of the atmosphere which is chiefly in question, we might find a more constant relation between Δt and Δp at all the stations.

I will now proceed to make some remarks which may aid in the study of these questions. I would first observe with relation to the stations in the preceding table that the value of k is only 0·024 at Chittagong, while it is nearly 0·029 at Saugor Island. I have no doubt, however, that this difference is due to some local or instrumental cause.

In the first article I have, as already stated, used only observations made in first-class observatories. Every one acquainted with the difficulties of obtaining good observations in India, especially at out-stations, will understand that the mere printing of their results cannot give them any certain weight. Thus from the tables of means given in Mr. Blanford's work, it appears that the value of k at Vizagapatam is 0·032, while at Cuttack less than 3° to the north, it is 0·025. This great difference would lead to the conclusion that there must be some remarkable local cause, or that there is some error in the observations; if the former, then farther research as to this cause would be of the highest importance; the latter seems to me the most probable explanation. The following example, that of a station so well known as Madras, will show some reason for this belief. The results for Madras, given in the table, are those employed in the first article, and deduced from observations made in the Magnetic and Meteorological Observatory from 1841 till 1855. In Mr. Blanford's tables, however, means are given from observations for nine years. These means give results markedly different from the others. The following summary for the months of December, January, and June, will prove this:—

Group of Years.	Height of Barometer. December.	January.	June.
1841–45	29·954	29·998	29·691
1846–50	·957	·986	·693
1851–55	·992	·998	·702
Means	·967	·994	·695
1868–71	·978	·967	·671
1872–76	·955	·926	·802
Mr. Blanford's means for nine years	·965	·944	·744

Now the three means for January, each deduced from five years' observations, do not deviate from the mean of the whole more than ·008 inch, while the corresponding extreme deviation for June is ·0 7 inch. Whereas the means from nine years, according to Mr. Blanford's tables, differ by 0·050 inch from the means of fifteen years, and the annual range, which is 0·299 by the fifteen years' observations, becomes only 0·200 by the last series. Judging from the means for four years—given by Mr. Blanford in his valuable memoir in the *Phil. Trans.* on the winds of North India—which I believe to be part of the nine years, the means for five years, 1872–76, give a range of only 0·124 inch from January to June; but even the mean pressure for the place and the annual law of variation is altered by the nine-year series, the maximum pressure occurring in December instead of January. It is essential in such investigations that some confidence can be placed in the observations, and if this can be done anywhere it is certainly in observations made at such a station as Madras. I have employed previously means deduced from fifteen years' observations in the Magnetic and Meteorological Observatory; but these means differ in a manner so extraordinary (for a South Indian station) from the means given by Mr. Blanford from nine ye observations, that this demands attention and explan tion.[1]

We see that the annual oscillation of pressure increa with that of temperature, and as shown in the ar already cited, that this relation holds for two places opposite sides of the Ghâts, nearly at the same lat within sixty miles of each other, for which the ann oscillations at one are twice those for the other.

Let us now see what our knowledge from laborat experiments of the laws of expansion and equilibrium gases would induce us to conclude with reference to stations in question.

In the first place, let us remember that the yearly m temperature at Pallamcottah is about 7° Fahr. grea than at Trevandrum, while the yearly mean pressu the same. We conclude at once from this result that mean pressure does not depend on the mean temperatu

I stated that the mean temperature in January at lamcottah, on the east side of the Ghâts, was 4° F greater than at Trevandrum, sixty miles distant on west side of the mountains, and that the mean pressu was 0·065 greater at the former than at the latter. John Herschel has shown that according to our kn ledge of the expansion of gases, there should be a s diurnal atmospheric tide due to one side of the w being warmer than the other, and this due to the ex sion of the gases in the warmer half causing the cen gravity of the air to be higher than in the other, an produce a sliding motion of the warmer air towards colder in twelve hours.

If such a result is what may be supposed to occ the period of a day, there cannot be the smallest d that if a mass of the atmosphere has a lower pressure a lower temperature than another mass at a short dist the former should flow towards the latter, and pr equilibrium within twenty-four hours. Here, how we find that there is a difference of pressure of 0·06 which remains during a whole month at a distan sixty miles, and this continued difference of pressu not to be explained by any known property of gases

We see, indeed, the remarkable fact that the osci of the monthly mean pressure at one station pro quite independently of that at the other, and both constant ratio with the variation of the temperature atmosphere in the lowest stratum.[2] All this is i cable by any heating action alone.

I have omitted all notice of the aqueous vapour atmosphere. It is obvious, however, that this explain the annual oscillation of pressure, since it when the tension of vapour is greatest, that the metric height is least. The introduction of more into the atmosphere does not make the whole light heavier; and when we adopt the arithmetical op of Dove and subduct the vapour pressure from th metric height, we find the oscillation to be great less, than before.

It is not easy to determine the variation of pressure from the indications of the dry- and w thermometers, and the exact result of the total above the barometer cannot as yet be determined, amount will not explain the annual law, nor will it the independent oscillations in question. I hav ever, long ago suggested that the humidity of the humidity of the lower mass are probably related temperature, the oscillations of pressure may related to them.

Sedgwick has said, in his inaugural discourse

[1] Mr. Broun asked me if I knew what years made up the nin know of no one except Mr. Blanford himself who can give a sa answer to this question, and he is in India. The "Vade Mecum official work, ought certainly to be trustworthy.—E. D. A.

[2] And probably of the mean temperature of a layer of some co height.

udies of his University: "To explain difficulties in ıese questions, the atmospheric strata have been shuffled ı accordance with laboratory experiments." Thus, for ĸample, the mean pressure of the atmosphere remains, n the average of the whole year, 0·038 inch lower for very 100 miles we proceed north in this country, a differnce which is called a *gradient*, as if it were a fall on a ailway line, though it is really the position of equilibrium ke that of the watery ocean, which has also a gradient f nearly thirty miles from the equator to the poles.

I have previously remarked that at Bombay the maximum pressure precedes nearly by a month the minimum emperature, while the minimum pressure is a month ater than the maximum temperature. This is also true or all the stations in North India. At Madras, however, ınd Trevandrum, January becomes the month of maximum pressure. I do not, therefore, place much weight ɔn this fact as showing that the two oscillations are not ɔause and effect. The month of maximum pressure at Pekin agrees most nearly with that of minimum temperature.

I have stated in the first article on this subject that I did not admit that the oscillation of pressure was due to that of temperature, and therefore could not allow that a higher annual mean temperature [would in any case cause a lower annual mean pressure] From the fact that the annual variation of pressure and temperature in Central Asia is greater than in any other portion of the globe, the greatest pressure coinciding nearly with the lowest temperature, and the least pressure with the highest temperature, it was concluded by Mr. Chambers that years of greatest mean pressure should also be years of least mean temperature. Now if we assume that the pressure depends only on the mass of the air and watery vapour in it, as the former is constant, and the latter, the only variable part, is greatest when the temperature is highest, it would follow that years of greatest heat should be years of greatest pressure, which is just the reverse of the conclusion deduced by the analogy from the annual variations.

Indeed, it is one of the great difficulties in the hypotheses which have been proposed, to explain the annual variation of pressure of the mixed atmosphere, that when we subduct the vapour pressure, as far as our means of calculating this exist, we have a much larger dry air oscillation than before.

I gave, however, different reasons for concluding that the range of temperature was not itself the cause of the diminished pressure, although the two go nearly together. One was that the observations of Bombay showed the greatest pressure to precede the lowest temperature by a month, and this is true for all the stations in the groups of North India already given. I also pointed out that were the two directly related, the mean pressure at Trevandrum should be greater than at Pallamcottah by nearly one-tenth of an inch, which is not the case, the isobars and isotherms having no relation to each other.

If we suppose that we have the same atmosphere over each station as over the whole earth, there is no possibility of explaining the variation of pressure by that of temperature. The only known property of heat which affects the mass has no doubt been employed to cause the hotter air to flow away somewhere, and surely in that case it should flow to the nearest colder station, where the pressure is less; but we have seen that this is not so in the case of Trevandrum and Pallamcottah, nor is it so in the valleys of the Ganges and Indus, where the oscillation increases as we ascend from the sea. These oscillations proceed with the greatest regularity, approximately in proportion to the temperature variation from month to month, and without the slightest regard to the hypothesis which should cause equilibrium in twenty-four hours, by the sliding of the most expanded masses over those least so. In what way, then, can we associate the two oscillations if one is not the cause of the other? I have long ago suggested that the varying humidity of the air may be in question; this is only a suggestion. I do not mean the mere tension of vapour—as already stated when we try to get rid of that from the total atmospheric pressure, the subject becomes more difficult, the dry air oscillation being greater not less than that of the whole—but if we suppose that the attraction of gravity is not the only attraction which affects the pressure of the atmosphere, but that this pressure varies through some other attracting force such as an electric attraction of the sun depending upon the varying humidity of the air, and this again depending on its temperature; we should find a method of relating the two variations which does not exist if gravitation alone is employed.

It is quite certain that many physicists will not admit the idea of an electric attraction on our atmosphere in the present state of our knowledge, hence the efforts to make expansion, and a shuffling of the atmospheric strata suffice. We must not, however, in our ignorance, attempt to force conclusions in opposition to facts, and if these can be satisfied more easily and with greater probabilities in its favour by the aid of the hypothesis of an electric attraction of the sun, that hypothesis will have a better claim to acceptation than the other.

I shall here note a few facts which cannot be explained by thermic actions.

1. I have shown that on the average of many years' observation in our latitudes the mean pressure diminishes at the rate of 0·038 inch of mercury for every one hundred geographical miles we proceed towards the north. This has been called a gradient from the similar term used in railway slopes; but it is no slope, it is a level of a surface of equilibrium like that of the sea. It is the mean heights of the barometer at the sea-level which indicate the form, if we may say so, of the equilibrating atmosphere.

2. In India we have seen that the atmospheric pressure oscillates at each station even when these are quite near to each other, independently of the known laws of equilibrium of pressure of gases.

When we turn to the semi-diurnal oscillation of the barometer we are only amused at the attempts made to explain it by shuffling the atmospheric strata. Nothing can be more certain than that the theories of expansion, or resistance to expansion and overflow, are the vain efforts to make the laws of nature agree with a theory. Over the great ocean within the tropics, where the diurnal variations of temperature are small and the air is absolutely without perceptible currents for days together, the barometer rises and falls a tenth of an inch twice in twenty-four hours with the regularity of the solar clock. The action of the sun on the whole atmosphere which produces this movement varies chiefly during the day hours at inland stations with the temperature oscillation, so that, as in the case of the annual variation, the fall of the barometer at 4 P.M. is greater in the same latitude as the temperature is higher. This variation occurs during the most complete calms; the smoke rises vertically from the plains of Tinnevelly; no current is visible in the motion of the clouds; yet the barometer falls at four in the afternoon as it did at four in the morning, only it falls farther.

THE ETNA OBSERVATORY

THE accompanying illustration of the Observatory on Mount Etna is reproduced from the *Memoirs* of the Italian Spectroscopic Society. It shows that the building is so far complete, and surmounted by its revolving dome for the protection of the large Merz equatorial of thirty-five centimetres aperture. In the engraving the volcanic cone appears much nearer the Observatory than it really is. The work of building was suspended during the stormy weather of 1879, but was completed in the summer of last year. But it cannot be said that the

building is yet quite finished and ready for occupation; a good deal of work has yet to be done to the internal walls, the doors and windows, flooring, &c., besides the scientific equipment of the building. Therefore the announcement by the Alpine Club of Catania that the building would be ready for inauguration at t of the Alpine Congress in Catania nex was premature. The Observatory will not re to be opened till 1882. The difficulties that be contended with can only be comprehen

who have visited the place; all the materials have to be conveyed 3000 metres above the level of the sea, and that during only three months in the year. So that even if not ready till 1882, the work may be said to have been rapidly accomplished. The mounting of the equatorial is finished and the construction of the apparatus is being proceeded with. Th Agriculture and Public Instruction are do provide the Observatory, by 1882, with a staff both of astronomers and meteorolo

---

MODE OF MASKING OR CUTTING OFF SHARPLY THE LIGHT FROM REVOLVING APPARATUS ON ANY DESIRED COMPASS-BEARING BY MEANS OF A RECIPROCATING SCREEN

OWING to the optical properties of the lens employed in revolving lights, a formidable element of difficulty comes in the way of effecting a sharp cut-off on a particular bearing; for the direction of the axis of the beam of light which is projected by the lens is being continually changed in the horizontal plane by the revolution of the frame on which it is fixed. So long as the axis of this beam of rays points outside of the line of obscuration the light will not of course encroach on the danger arc, unless to a small extent, when the axis is nearly on the line of cut-off due to the ex-focal rays proceeding from the outer edges of the flame. The light however will begin to be diminished in power from a bearing varying from 12° to 21° outside of the line of cut-off dependent on the size of the lens, the light on the line of cut-off being diminished to the power of one- the axis crosses that line, then as the r from that part of the apparatus which i the darkened panes of the lantern is not them, the light will begin to be seen wi danger, and as the apparatus goes on revol at last point from about 12° to 21° within according to the breadth of the lens whi Owing to this peculiarity of a revolving li of confining the flashes within any requ horizon by means of *fixed* screens is in mountable one.

The mode which I have to suggest is front of the revolving apparatus and on of the danger arc, let a light canvas or be constructed for running on rollers on a rail or circular path close to the apparatus projecting rod or snug be fixed to the si it will in revolving be brought against screen, and will gradually press the scre the inclined plane at the same rate of mo

that of the lens forwards. By the time the lens reaches the edge of the danger-arc the screen will have been pushed to the top of the inclined plane, and the full beam of light coming from the now entirely uncovered lens will be pointing in the required line of cut-off which is the border of the danger-arc. But whenever the further revolution of the apparatus causes the snug to pass clear of the edge of the screen so as to free it from pressure, it will immediately run back again to its original position in front of the lens, so as to prevent any light being now sent forwards. If that light were not at once intercepted part of it would, by the movement of the flame, begin to pass across the line of cut-off, so as to be seen within the danger-arc. By this continued reciprocative movement of the screen as lens after lens comes round, the same effect will be successively produced, and the light will always be cut off in the line of obscuration as sharply as in the case of a fixed light, so that the flashes will never be seen within the danger-arc.

In cases where the light has to be cut off on both sides of a danger-arc a similar reciprocating screen is as applicable to the lenses when passing out as when passing into the danger-arc. But in this case the lens, on leaving the danger-arc, will take the screen round with it up an inclined plane until the axis of the lens is parallel to the line of cut-off, when the screen will recoil and the light become visible with full power in the line of cut-off.

A small spherical mask placed inside of the apparatus may be made to produce the same effect by reciprocating between the lenses and the flame. When the danger-arc is of small amplitude the screens, which must always be as broad as the lens, might come in the way of the light passing over the safety-arcs. To obviate this, cloth curtains might be made to wind up on vertical rollers similar in construction to those used for ordinary house-blinds.

THOMAS STEVENSON

CHLOROPHYLL[1]

AN account was given in NATURE, vol. xxi., p. 85, of Prof. Pringsheim's first publication on this subject. He had then found that exposure to intense light for a few minutes causes the chlorophyll-corpuscles contained in the cells of plants to lose their green colour; he also pointed out that this effect is produced not by heat but by light, and only in the presence of oxygen, and further, that the highly refrangible rays of the spectrum are those which are principally concerned in it. He also announced the discovery in the chlorophyll-corpuscles of a substance termed Hypochlorin.

The paper now under consideration gives a full account of all the observations and experiments which he has made up to the present time, and he considers that they tend to confirm the conclusions at which he had previously arrived. It will be well, before entering upon a discussion of the very difficult questions which are raised, briefly to enumerate the principal new facts which he now brings forward.

In the first place, he is able to throw some light upon the intimate structure of chlorophyll-corpuscles by means of a new method for investigating them. This method consists in treating them with a dilute acid (*e.g.* 1 vol. of glacial acetic acid to 2 of water, or 1 vol. of picric acid to 3-6 of water, or 1 vol. of sulphuric acid to 20-40 of water, or 1 vol. of strong hydrochloric acid to 4 of water), or warming them in water, or exposing them to the action of steam. The effect of this treatment is to cause the escape of the chlorophyll from the corpuscle, together with certain fluid or semi-fluid substances which accompany it, in the form of viscid drops, leaving the ground-substance of the corpuscle as a colourless, apparently protoplasmic, hollow sphere, with a much perforated wall.

[1] "Untersuchungen über Lichtwirkung und Chlorophyllfunction in der Pflanse," by Prof. N. Pringsheim (*Jahrbücher für Wiss. Bot.*, Bd. XII., Heft 3: Leipsig, 1881).

These viscid green drops, when produced by the action of warm water or of steam, appear to consist of an oil which holds the chlorophyll and other substances in solution. When they are produced by means of a dilute acid, they appear to contain a substance which is not present when they are extracted by warm water or by steam. Certain dark brown masses make their appearance which are of a tolerably firm consistence and of varying form. These gradually become harder, and assume a crystalloidal appearance, probably, as Prof. Pringsheim suggests, in consequence of a conversion into resin of the oily matter which is present; but it is by no means the whole of the substance which thus solidifies, but only a certain constituent of it. The colour of the mass is doubtless due to the presence of altered chlorophyll, and this may affect even the crystalloids, but they may be obtained colourless. It is to the substance which assumes the crystalloidal form, or rather to some substance pre-existent in the chlorophyll-corpuscle from which these crystalloids are derived by the action of the acid, that Prof. Pringsheim gives the name of Hypochlorin.

He meets the doubts that may arise as to the chemical individuality of this substance, as also the suggestion that it may be a product of the alteration of the chlorophyll, by pointing out that it cannot usually be obtained at any one time from all the corpuscles of a given cell. It is therefore a substance which, as it is present in some and not in others, cannot be derived from chlorophyll which is present in them all, and which probably bears some definite relation to the metabolic processes going on in the corpuscles.

Since no hypochlorin can be obtained from cells which have been warmed in water or acted upon by steam, it appears that this substance is decomposed by heat.

After giving a detailed description of the arrangement of the apparatus used in his observations, Prof. Pringsheim goes on to give an account of the effects produced by exposure to intense light in the different parts of which the cell consists. He again insists that none of the following phenomena can be the results of excessive heating of the object, for he found that cells not containing chlorophyll (*e.g.* colourless zoospores) could bear the exposure for half-an-hour without injury, and further, that the phenomena were produced more readily by blue or green light than by red light which has a much greater heating effect. The principal phenomena observed are as follows:—

1. The colouring-matter.

The chlorophyll-corpuscles lose their colour in a few minutes, but this does not take place when oxygen is not present, nor in red light. There is no trace of chlorophyll left in the corpuscles. Prof. Pringsheim is therefore of opinion that its decolorisation is a phenomenon of oxidation, and that the products are gases. Further, this disappearance of the chlorophyll is not prevented by the absence of carbonic acid gas. The corpuscles which have lost their green colour do not regain it, although the cell in which they are contained, still continues to live; on this account Prof. Pringsheim regards the decomposition of chlorophyll as a pathological and not as a normal process.

Colouring matters, other than chlorophyll, which occur in the cells of plants, are likewise decomposed, but not all of them. Thus, the blue pigment of the Phycochromaceæ, the brown of Fucus, the red of the Florideæ, the orange of the corolla of Calendula, the blue in the cells of the staminal hairs of *Tradescantia virginica*, disappear, but the blue pigment in various flowers is not decomposed by exposure to intense light.

2. The ground-substance of the chlorophyll-corpuscles and their contents.

If a cell of Nitella or of Spirogyra be killed by the action of heat, for instance, the chlorophyll-corpuscles of the one and the spiral band of the other will absorb water

and swell up. If the cell has been killed by prolonged exposure to light, no such absorption of water will take place.

Prof. Pringsheim mentions starch, oil, and tannin as commonly occurring in the chlorophyll-corpuscles[1]; these substances, which contain a considerable proportion of oxygen in their molecule, are not affected by the action of light.

3. Hypochlorin.

No trace of this substance can be detected in cells which have been exposed.

4. The protoplasm of the cell.

The turgidity of exposed cells is lost; the protoplasm readily allows colouring matters to pass through it, and treatment with plasmolytic reagents produces no contraction. In a long cell, part of which has been exposed to the action of light, it is only the portion of the protoplasm which has been exposed that exhibits these alterations in its properties. Moreover, these changes are apparently accompanied by a perceptible loss of substance.

A brief exposure causes an arrest of the rotatory movements of the protoplasm in cells which exhibit it. If the exposure has not been prolonged, these movements will recommence after a time. If a portion only of such a cell be exposed for not too long a time, the movements will be arrested in the exposed portion, whereas it continues in the rest of the cell.

5. The cell-wall.

The only effect which the exposure produced on cell-walls appears to have been that the cells of the more delicate filaments of species of Spirogyra and Mesocarpus become isolated.

The following are the general conclusions which Prof. Pringsheim draws from the facts which have been stated above. He concludes that the injurious effects produced by the exposure of a cell to intense light in an atmosphere containing oxygen, are due to an increased oxidation of certain substances which are essential to its life. The rays which are active in this process are not those which reach the interior of the cell after having passed through the chlorophyll-corpuscles, but those which reach it directly. He finds, it is true, the cells which do not contain chlorophyll are, on the whole, less sensitive to the action of light than those which do contain it, but there are no grounds for believing that this greater sensitiveness is due to the absorption of any light-rays by the chlorophyll. On the contrary, the presence of chlorophyll in a cell seems rather to diminish than to increase the oxidising action of light. Facts are adduced to show that chlorophyll exercises a protective influence in this respect, and it is further pointed out that the death of the cell, when exposed to intense light, takes place *before* the complete decolorisation of the chlorophyll-corpuscles has been effected. The greater sensitiveness to the action of light of a cell containing chlorophyll is ascribed to the presence in it of the readily-oxidisable products of its assimilatory activity, and of these hypochlorin is the most important.

Prof. Pringsheim's theory of the function of chlorophyll is, then, (1) that the respiration of a cell is increased by exposure to light; (2) that, in consequence of the absorption which takes place when light passes through chlorophyll, the presence of chlorophyll in a cell tends to counteract the influence of light, so that, when the light is not intense, the respiration of the cell is so far diminished that processes of reduction can take place within it, but when the light is very intense the chlorophyll itself undergoes decomposition, and the death of the cell is brought about by the excessive oxidation of certain of its essential constituents.

[1] He quotes the observations of Briosi to prove that oil, and not starch, is the substance which is formed in the chlorophyll-corpuscles of the Musaceæ, without being aware, apparently, that Briosi's results have been shown to be incorrect by Holle and Godlewski ("Flora," 1877).

After having stated his own views, Prof. Pra proceeds to criticise the current hypotheses co the function of chlorophyll. The first of these is according to which chlorophyll is itself conver carbohydrate in the assimilatory process. It is to understand, from a chemical point of view, ho conversion can be effected in the plant, and it quite impossible when it is shown, as Prof. Pri has done, that chlorophyll does not undergo ceptible change when it is exposed to light in sphere containing carbonic acid but no oxygen. The relates to the absorption-spectrum of chlorophy question naturally arises as to whether or not which chlorophyll absorbs are those which e reduction of carbonic acid and water in the chlo corpuscle. That it must be answered in the aff clear when it is borne in mind that the maximum decomposition of carbonic acid does not coincid the maximum of absorption in the chlorophyll-spe From what source, then, is the energy derived w necessary for this reduction? It is derived, accord Prof. Pringsheim, from light-rays absorbed, not chlorophyll, but by the other cell-contents. He opinion that the chlorophyll takes no direct part process.

The next question which is dealt with is the e of an optimum intensity of light for the decompos carbonic acid. Prof. Pringsheim does not consid this is the intensity which effects the greatest evol oxygen, for, from his point of view, the amount of given off at any time is the resultant of the action distinct processes, respiration and assimilation, bo which are affected by the intensity of the ligh concludes that, so far as an actual gain of car concerned, there is no general optimum intensity applies this mode of reasoning also to the question relative activity of the different rays of the spectrum the process of assimilation. The green and yellow have been found to be more active than the blue, be as he points out, they are not absorbed to the extent by the chlorophyll, and not because the endowed with any special reducing power. Fin proceeds to the discussion of the fact that the vo of an atmosphere in which green plants are expos light remains constant. This fact has led to the sion that, since the volume of carbonic acid decom and of oxygen exhaled is the same, the substance fo in the process is a carbohydrate. Prof. Pringsh inference from this fact is very different. He argues since oxidation and reduction are going on simultaneo the substance formed contains a smaller quantity oxygen than a carbohydrate,—in fact a quantity is smaller by just that amount of oxygen which has used up in respiration.

Stated in the briefest possible manner, Prof. Pringsh principal results are as follows:—

1. That the presence of chlorophyll favours the ass latory activity of the chlorophyll-corpuscle in consequ of the absorption, by the chlorophyll, of light, w would promote the respiratory activity.

2. That hypochlorin is the substance which is the visible product of this assimilatory activity, and the other substances (starch, glucose, oil, tannin), w are found in chlorophyll-corpuscles are derived hypochlorin by oxidation. This conclusion is based the general occurrence of hypochlorin in chloro corpuscles, upon the fact that the amount of hypoc in a corpuscle varies inversely as the quantity of which is present, and upon the observation that hy chlorin cannot be detected in seedlings until they been exposed to light of such an intensity as to ca them to assimilate.

It is of interest to note that hypochlorin make appearance at the later stages of germination in

SYDNEY H. VINES

NOTES

from the *Times*.—At their meeting
Council of the Royal Society selected,
fifty-two candidates for the fellowship,
ecommended to the Society for election
June 2 next:—W. E. Ayrton, H. W.
H. M. Christie, G. Dickie, A. B.
Kempe, A. Macalister, H. McLeod, J. A. Phillips, W. H. Preece, R. Samuelson, M.P., B. B. Stoney, R. H. Traquair, Rev. H. W. Watson, C. R. A. Wright.

A *conversazione* of the Society of Telegraph Engineers was held in honour of Prof. Helmholtz in the rooms of University College on Monday night. Among those who were present to meet the guest of the evening were many eminent English men of science. Many of the members of the Society and other had lent instruments and apparatus showing some of the purposes to which electricity has recently been applied, and also the means by which electrical research is still being carried on. On entering the College grounds the visitors saw a very pretty effect caused by one of Mr. Crompton's electric lights, which had been placed on the top of the portico. The reception-room itself was lit up with little incandescent electric lamps on Mr. Swan's principle. They were arranged in bunches of three or four in ground glass globes suspended from the ceiling, and in fact at first sight they looked like very brilliant gas-burners, no wires being visible. On each side and down the centre of the room were placed tables on which were arrayed all the newest inventions in electrical science. On one it was demonstrated how perfectly easy it was to manage Mr. Swan's lamps; taking one lamp out of the stand and putting in a new one occupying only a few seconds, there being no binding-screws or switches to attend to. Perhaps the most interesting experiment of the evening was the transmission of pictures of natural objects by telegraph, the picture of a butterfly being most beautifully transmitted by means of a selenium plate. This was shown by Mr. Shelford Bidwell's telephotographic machine. Mr. Latimer Clark exhibited some rare books on electricity and magnetism, autographs and portraits of eminent electricians; also a portion of the original telegraph line which was laid by the late Sir Francis Ronalds in 1816, with the original model of Ronalds' telegraph, the original type cast for the Morse telegraph, with autograph of Prof. Morse, and a portion of line laid by W. F. Cooke in 1837. Mr. Cotterell of the Royal Institution exhibited a very delicate mercury electrometer on Lippman's principle, belonging to Prof. Dewar; and Mr. Robert Sabine performed some pretty experiments illustrating the cause of the motion of the mercury. Mr. Stroh showed the beautiful apparatus made by him to illustrate Prof. Helmholtz's vowel theory, and Mr. Preece performed several experiments in explanation of the remarkable sounds produced by intermittent light on solid, liquid, and gaseous matter. Mr. George Lund, of the firm of Messrs. Lund and Blockley, exhibited some synchronous clocks for the London, Chatham, and Dover Railway Company for coupling up two ordinary telegraph lines at 10 a.m., in order to send the time current. They also applied to the clock a novel automatic arrangement of their own invention, by which, at two minutes to 10 a.m. daily, the current will ring a warning bell, couple up and block against false currents two ordinary telegraph wires, then at 10 a.m. the clock sends the time-current of two seconds' duration, giving time to the clocks in circuit. Immediately upon the termination of the two seconds' current the lines will be automatically re-established as distinct lines for their ordinary telegraph purposes. All present were pleased to have the opportunity of inspecting Prof. Kennedy's engineering laboratory, where the machine for testing the strength of materials up to fifty tons was seen in operation, and various pieces of brass and copper were tested. The machine-tools were in operation, and a steam-engine of peculiar construction driving them. We look forward with interest to the scientific results we may expect to be brought to light with the testing-machine. The President (Prof. Carey Foster) showed some interesting electrical instruments; Mr. Richard Anderson a portable galvanometer for testing lightning-conductors; Profes-

sors Ayrton and Perry a variety of apparatus, as also Siemens Brothers, Newall and Co., and others. Prof. Helmholtz ended on Tuesday his visit to London, and went with Mr. Spottiswoode, president of the Royal Society, to his country house at Coombe Bank, Sevenoaks. From thence he proceeds to Dublin to receive an honorary doctor's degree from the University of that city.

THE National Fisheries Exhibition will be opened at Norwich by the Prince of Wales on the 18th inst. The delay in opening it has been caused by the necessity for enlarging the space to admit of satisfying the numerous applications that have poured in. Every point connected with the growth and nurture of fish, the modes of capturing them, the condition of the fishermen will be illustrated. The aquatic fauna of Norfolk and Suffolk will be a special feature, as also fish-eating birds. The Earl of Ducie, Viscount Powerscourt, Lord Lovat, Mr. Spencer Walpole, and Prof. Huxley, H.M. Inspectors of Fisheries; and Mr. Calcraft, Permanent Secretary to the Board of Trade, have been appointed by the Home Secretary to act as Her Majesty's Commissioners. In addition to a large number of special money prizes, Government gold, silver, and bronze medals, diplomas of honour, will be awarded by the jurors. Prof. Huxley will give an address on the occasion.

MUSEUM No. 1 in the Royal Gardens, Kew, will be reopened to the public on Easter Monday, after being closed during the winter. It has been enlarged by the addition of a new wing, terminating in a wide staircase with ascending and descending flights. The expense has been borne by the India Office in consideration of the maintenance at Kew of the botanico-economical collections recently forming part of the India Museum. The whole collections have been entirely re-arranged by the curator, Mr. John Jackson, A.L.S. On the staircase has been placed a large painted window, presented to the museum by Alderman W. J. R. Cotton, M.P. This window represents the successive stages of cotton cultivation and manufacture. Amongst other recent additions to the museum may be mentioned a series of models of farm and garden vegetables prepared and presented by Messrs. Sutton of Reading; a collection formed by Col. Pearson, who has charge of the Indian forest-students at Nancy, of the various objects manufactured in France from native-grown woods; a further series of vegetable products and manufactured articles, collected in Afghanistan by Surgeon-Major Aitchison. The collection of portraits of botanists has also been much enlarged and re-arranged. An oil portrait of Thomas Andrew Knight, F.R.S., well known for his classical researches in vegetable physiology, has been presented on behalf of the family by Sir Charles Rouse Boughton, Bart.

THE President of the United States of America has notified to the French Government his intention of appointing a special commission to preside over the arrangement of the American Section at the Electrical Exhibition. A number of commissioners have been already selected for the purpose. M. Philippart has written to M. Berger, placing at his disposal a sum of 4000*l.* for the best system presented of transporting electric force at a distance.

ON Sunday week a deputation composed of eminent representatives of French science waited upon the venerable M. Milne-Edwards to present him with a medal in commemoration of the completion of the great naturalist's work on Comparative Physiology and Anatomy. Warm congratulatory addresses were made by MM. Quatrefages, Blanchard, and Dumas, the last speaking of himself as the oldest of M. Milne-Edward's friends. In thanking the deputation the recipient of this well-earned honour was naturally much moved.

ON March 26, in presence of the Minister of the Interior, the Commission of the Observatory, several State functionaries and men of science, there were repeated at the Brussels Observatory experiments with Van Rysselberghes' telemeteorograph to prove that the registration of the meteorological elements by this instrument may be made automatically at very great distances (several hundred kilometres). The author explained to the Minister a plan of International Telemeteorography, the realisation of which would be of the greatest interest to the scientific study of the atmosphere, and which would render possible the prevision of the weather.

THE destruction caused by the Chios earthquake is even greater than we stated last week. The Constantinople Correspondent of the *Daily News* sends some interesting particulars: The temperature on the 3rd was heavy and oppressive, and the horizon was broken by broad flashes of light like sheet lightning to denote a coming storm. In all this atmospheric disturbance however the inhabitants saw nothing extraordinary, and were far from being alarmed by what they fancied would be another thunderstorm. At ten minutes to two in the afternoon a terrific shock was felt, bringing three-fourths of the houses in Chios to the ground like so many packs of cards, and burying thousand persons under the falling ruins. Then commenced a fearful scene of horror. The ground rocked and heaved, kneading the ruin already formed into an unrecognisable mass of stone. The survivors ran hither and thither, not knowing where to flee to escape the horrible fate that menaced them. They were tossed and flung about by the heaving earth, like straws in a breeze. Even those who gained the open country were by no means safe. The earthquake attacked not only the towns and villages, but worked its ravages in the hills and mountains of the island. Enormous masses of rock and earth came thundering down the hill-sides, carrying all before them, bounding across the plains, and tearing roads in the solid rocks of the mountains such as might have been formed by a torrent a thousand years old. The town presented a pitiable spectacle. Great fissures and crevices yawned in the streets, walls were falling with a crashing report, and entire buildings crumbled in fragments to the ground. In many places whole streets had disappeared, and it was hard to say where the different well-known buildings had been. The ground still heaved and tossed, bringing fresh victims to the ground at every moment, and hurrying innumerable others to destruction. It is impossible to say what the number of victims would have been if a second shock had not thrown down the ruins formed by the first and thus permitted thousands of sufferers to escape or to be rescued by others from the horrible imprisonment to which they had been condemned. The great fissures and crevices run from east to west. In the country the effects of the horrible upheaval have been even more terrible than in the town. The shocks are now, April 8, diminishing, but all there were counted 250 since the first three awful shocks which destroyed the greater part of the island. A telegram of the 12th states that earthquake shocks of considerable violence have recommenced in Chios, and it is estimated that only twenty houses now remain habitable in the whole island. Four or five villages have been totally destroyed, and in many cases the population has absolutely disappeared.

SOME slight shocks of earthquake were felt on the morning of the 5th inst. at San Cristobal, Cuba. A violent shock was felt at two o'clock on Sunday morning throughout the coast of California. Earthquakes were reported from South Hungary Wednesday last week.

THE *Daily News* Naples correspondent, telegraphing on the 6th, states that Mount Vesuvius was displaying greater activity. Abundant streams of lava were descending northwards. Two great numbers of smoke fissures had opened round the crater, some at 100 metres distance from the centre of eruption.

F. C. V. RILEY has just published, in the Second Report : United States Entomological Commission, "Further about the Natural Enemies of Locusts," meaning, of , by the latter term, the Rocky Mountain pest in particular. bservations entirely concern insect parasites. The most sting are on the habits of two species of *Diptera*, allied to *ylius*, the larvæ of which feed on the eggs of "locusts." plate (xvi.) illustrating the subject is above praise, not only count of the scientific accuracy shown in the drawings h are by the author), but also as regards the reproduction em by the "lithocaustic" process adopted by a Baltimore We have seen other plates of entomological subjects ating from the same firm, and the impression formed on our is that no other process is equally adapted for the purpose. cannot some of our own enterprising "lithographers" uce the same result?

HE following are the lecture arrangements after Easter, at Royal Institution :—Prof. Dewar, M.A., F.R.S., six lectures ne Non-Metallic Elements, on Tuesdays, April 26 to May Prof. Tyndall, D.C.L., F.R.S., six lectures on Paramag- m and Diamagnetism, on Thursdays, April 28 to June 2; . H. Morley, three lectures on Scotland's Part in English rature, on Saturdays, April 30, May 7, 14; one lecture on mas Carlyle, on Tuesday, June 7; Mr. E. C. Turner, or at the University of St. Petersburg, five lectures on the at Modern Writers of Russia, on Saturdays, May 21, 28, 4, Thursday, June 9, and Saturday, June 11. The Friday ing meetings will be resumed on April 29, at 8 p.m. Prof. . Blackie, F.R.S.E., will give a discourse on "The Lan- ge and Literature of the Scottish Highlands," at 9 p.m. ceeding discourses will probably be given by the Hon. G. Brodrick, Mr. Francis Galton, Mr. W. H. Pollock, Prof. E. Roscoe, Prof. W. G. Adams, and Prof. Dewar.

THE usual course of Mayfair Lectures will commence, under auspices of the National Health Society, on Friday, April 22, 13, Hertford Street, Mayfair. The list of lecturers will this r include the names of Dr. Siemens, F.R.S., Dr. Robert rquharson, M.P., and Prof. Fleeming Jenkin.

WE are glad to find from an announcement in the current mber of the *Quarterly Journal of Microscopical Science* that . C. T. Hudson, of Manilla Hall, Bristol, is preparing a lume for the Ray Society on the "British Rotifers." Dr. dson is known not only for his numerous contributions to our owledge of this group, but especially for his discovery and cellent illustrations of one of the most important members of e group (Pedalion). Dr. Hudson will have the advantage of e use of Mr. P. H. Gorse's beautiful drawings of Rotifers, hich that observer has placed at his disposal.

A LARGE party of the Members of the Geologists' Association ere on Saturday last conducted through the Geological Depart- ent of the British Museum (Natural History), South Ken- ngton, by Dr. Henry Woodward, F.R.S., &c., the Keeper of at Department.

Apropos of the meeting of the French Association at Algiers e *Revue Scientifique* for April 9 devotes most of its space to a ries of articles on Algeria, its colonisation, statistics, botany, nthropology, hygiene, and zoology.

THE additions to the Zoological Society's Gardens during the ast week include a Macaque Monkey (*Macacus cynomolgus*) rom India, presented by Mr. R. J. Short; a Common Para- loxure (*Paradoxurus typus*), from India, presented by Mr. C. W. . Fletcher; a Viverrine Cat (*Felis viverrina*) from India, pre- ented by Major C. R. Oxley; two Squirrel-like Phalangers *Belideus sciureus*) from Australia, presented by Mr. D. W. Barker; three Paradise Whydah Birds (*Vidua paradisea*), a Pin- tailed Whydah Bird (*Vidua principalis*), a Red-shouldered Weaver Bird (*Urobrachya axillaris*), a Red-beaked Weaver Bird (*Quelea sanguinirostris*), a Wiener's Finch (*Pytelia wieneri*), two Yellow-rumped Seed-Eaters (*Crithagra chrysopyga*) from Mozam- bique, presented by Mr. Maurice C. Angel, F.Z.S.; two Laughing Kingfishers (*Dacelo gigantea*) from Australia, presented by Mr. Edward Trelawny; an Alexandrine Parrakeet (*Palæornis alex- andri*) from India, presented by Mr. Henry Day; a Common Gannet (*Sula bassana*), British, presented by Mr. G. Randall; a Common Marmoset (*Hapale jacchus*) from South America, deposited; an Indian Chevrotain (*Tragulus meminna*) from India, six Weeper Capuchins (*Cebus capucinus*) from Brazil, four Chestnut-eared Finches (*Amadina castanotis*) from Australia, three Common Crowned Pigeons (*Goura coronata*) from New Guinea, an American Tantalus (*Tantalus loculator*) from South America, purchased; two Sclater's Curassows (*Crax sclateri* ♂ ♀) from South America, on approval; an Indian Darter (*Plotus melanogaster*) from India, received in exchange.

GEOGRAPHICAL NOTES

THE Royal Medals of the Geographical Society have this week been awarded as follows :—The Founder's Medal to Major Serpa Pinto, "for his remarkable journey across Africa, from Benguela to Natal, during which he explored nearly 500 miles of new country, defined the fluvial systems of the southern slopes of the Benguelan Highlands, and fixed the position of numerous places by a series of astronomical observations; also for the admirable account of his journey, now in course of publication in London, containing numerous original maps, tables of observations, and a large amount of valuable and exact informa- tion regarding the African interior;" and the Patron's Medal to Mr. Benjamin Leigh Smith, for his discoveries on the south coast of Franz-Josef Land during last summer, as well as for his previous expeditions along the north-east land of Spitzbergen.

AT the meeting of the Geographical Society on Monday last Mr. R. N. Cust read a paper by Col. Tanner on Kafiristan and the Siah-posh Kafirs of the Hindu Kush. The paper, which was hardly a geographical one in any sense, dealt chiefly with the inhabitants of the Valley of Dara Nur and the Chugan tribe, and to a less extent with the Kafirs, who are called "Siah- posh" from their wearing black clothes, and furnished some very interesting information regarding their manners and customs. Some philological notes had also been sent by Col. Tanner, but these will be communicated to the Asiatic Society. Some of the more striking passages in Col. Tanner's notes, if we re- member rightly, were read at the Swansea meeting of the British Association. As much interest attaches to Kafiristan and the Kafirs, and the results expected from Col. Tanner's expedi- tion were so eagerly looked forward to, it was rather disap- pointing to be told by Col. Yule that we have even now learned no more than was buried in the record of a Jesuit Missionary's travels some 200 years ago. No doubt had his health not failed at the critical moment, and compelled him to return to India, Col. Tanner would have succeeded in penetrating into Kafiristan itself, and collected valuable geographical infor- mation.

THE Society formed at Milan for commercial exploration in Africa is showing increased activity, and has despatched another expedition to Tripoli, under the command of Capt. Camperio, who is accompanied by Signor Cingia, an ex-cavalry officer. The principal objects of this expedition are the explora- tion of the Gulf of Bomba, and it will particularly examine the ports of Tobruek and Derna, not far from the Egyptian frontier. Capt. Camperio will afterwards make an attempt to penetrate into the interior of the oasis of Jazabud, in order to open com- mercial relations with its inhabitants.

WE are glad to learn that there is good hope that Col. Flatters and many of his followers, who were reported to have been massacred by the Touaregs, are still alive, though probably retained as prisoners.

DOCTORS SCHWEINFURTH AND RIEBECK, who have been travelling in Egypt, left Cairo last month to explore the island of Socotra. They do not seem to be aware that quite recently

Prof. I. B. Balfour visited the island on behalf of our Zoological Society.

THE April number of *Petermann's Mittheilungen* has a long article, with map, on Mr. A. Forrest's expedition through North-West Australia in 1879; Herr Clemens Denhardt continues his paper on Researches in Equatorial East Africa; Herr F. v. Stein gives details on the new French land fortifications, with map, and there are several interesting letters from Dr. Junker, on his experiences in the Niam-Niam country.

NO. 2, for 1880, of the *Bulletin* of the American Geographical Society contains an unusually interesting paper by Prof. J. B. M'Master, of Princeton College, on the Bad Lands of Wyoming, in which he endeavours to trace out their geological history; Mr. B. R. Curtis describes his journey round the world; and there is a historical article on Arctic Exploration by the Rev. B. F. De Costa.

THE *Bulletin* of the Antwerp Geographical Society (tome v. fasc. 6) contains a paper of considerable value by the Abbé van den Gheyn, on the present state of research with regard to the primitive cradle of the Aryan race. M. A. Baquet contributes a paper on the fauna and the chace in the countries of South America watered by the Paraguay and the Parana.

CHEMICAL NOTES

B. HEINDL has recently made investigations into the compounds of calcium chloride with ethyl alcohol, isobutyl alcohol, and amyl alcohol, and has obtained the following formulæ:—

$CaCl_2 . 3(C_2H_6O)$; $CaCl_2 . 3(C_4H_{10}O)$; and $CaCl_2 . 3(C_5H_{12}O)$.

IN continuation of his investigation of the action of hydrochloric acid on metallic chlorides, already referred to in these notes, M. Ditté describes several new compounds of this acid with mercuric chloride, viz.,

$2HgCl_2 . 4HCl . 7H_2O : 3HgCl_2 . 4HCl . 7H_2O$:
$2HgCl_2 . HCl . 6H_2O : 4HgCl_2 . 2HCl . 9H_2O$: and
$3HgCl . HCl . 5H_2O$.

MM. FOUQUÉ AND LÉVY describe (in *Compt. rend.*) the artificial preparation of the basaltic minerals peridote and labradorite, by prolonged heating of a homogeneous mixture of the constituents of a basalt rich in olivine.

DR. A. R. LEEDS has recently examined the action of nitrogen tetroxide—N_2O_4—on various hydrocarbons (*Journ.* of American Chem. Soc.). The results are interesting, and promise to be even more so. Benzene, when acted on by N_2O_4 yields mononitro-benzene, picric acid and oxalic acid; two other compounds were also obtained, but under conditions which have not been successfully realised a second time. One of these the author calls monoxy-benzene—C_6H_4O—an isomer or metamer of quinone; the other has not been purified. Naphthalene yields mononitronaphthalene, α and β dinitro-naphthalene, and two compounds which, so far as they have been examined, appear to be napthodiquinone, $C_{10}H_4O_4$, and tetroxy-naphthalene, $C_{10}H_8O_4$. The products of the action of nitrogen tetroxide on cymene are chiefly α nitrocymene (probably also a dinitro derivative) and paratoluic acid.

THE American Chem. Soc. *Journal* (vol. i. Nos. 11 and 12) contains an interesting historical sketch of the lines of discovery of ozone, and of peroxide of hydrogen, by Dr. A. R. Leeds; to these papers is added a full list of references to all publications on ozone and hydrogen peroxide; the ozone references occupy thirty-two pages, and the hydrogen peroxide, ten pages.

AN important paper by M. Étard—important both by reason of the results obtained and because of the nature of the problem attacked—on the oxidising action of chromyl dichloride, appears in *Annales Chim. et Phys.* for February. M. Étard has studied the mechanism, so to speak, of the chemical changes which occur when chromyl dichloride acts as an oxidiser; he finds that in the case of the hydrocarbons containing methyl groups attached to an "aromatic" nucleus the methyl groups are transformed into the aldehydic group (COH), and that when the aromatic nuclei are themselves attacked, quinones are produced. The chromyl dichloride forms compounds with the aromatic hydrocarbons, which may be formulated as $X . 2CrO_2Cl_2$ (where X = hydrocarbon): these compounds are then decomposed by water, and yield the products already mentioned.

IN the same journal there is a lengthy and interes... by M. W. Spring on the effects of great pressure ... bodies. It is shown in this paper—which is chiefly pr... that the particles of crystalline bodies tend to solder the... closely together at high pressures, the effect of press... analogous to that of fusion; and that amorphous bodies ... divided into two classes, viz. those which behave like ... crystalline bodies, and those which are not thus affected ... pressures.

THE influence of pressure on chemical changes is ... sidered, and it is shown that as a general rule a chemical ... which results in the production of a system the volume of ... less than the volume of the initial system, may be brought ... by subjecting the initial system to great pressure, but ... change involves an increase of volume, pressure alone ... cause the change to proceed.

M. BRAME describes (in *Compt. rend.*) experiments ... with pure hydrocyanic acid, the results of which seem ... that the bodies of animals killed by this acid (pure ... undergo decomposition even when kept for a month. ... acid remains during that time in the animal tissues, ... in the stomach, and that the acid is readily obtained ... tion from the tissues of a herbivorous, but much less ... those of a carnivorous animal.

IN continuing his researches on chemical affinity Herr ... (*Journ. für pract. Chem.*) has made the remarkable ... that while the solvent action of polybasic acids ... diminished by the presence of the normal salts of ... employed, the solvent action of monobasic acids is ... increased by the presence of the normal salts of these ... his third paper Herr Ostwald gives a large series of ... ments which show that the solvent action of free nitric ... chloric acid on calcium or zinc oxalate is increased by ... potassium, sodium, ammonium, or magnesium nitrate ... The solvent action increases proportionally to the increase ... quantity of normal salt added. Ostwald confesses that ... as yet give no thoroughly satisfactory explanation of ... menon; the explanation which appears at present most ... involves the assumption that there is a slight chemical ... between the normal salt (potassium nitrate, &c.) and ... which is being dissolved by the acid (calcium or zinc ... this small chemical change alters the "stability" of the ... system, and so increases the amount of the primary change ... solution of calcium oxalate, &c., in a given time.

FROM thermochemical data J. Thomsen regards the ... accepted formula for benzene as incorrect. The number ... by him for the heat of combustion of benzene (805,300 ... units) agrees fairly well with that calculated (800,400 ... assumption that all the carbon atoms in benzene are ... linked." The heat of combustion of the metamer of ... viz. dipropargyl, is, according to Berthelot, 853,600 ... Thomsen's caculations, assuming the formula

$$HC{\equiv}C{-}CH_2{-}CH_2{-}C{\equiv}CH$$

to be correct, give the number 888,400. The formula given for dipropargyl is therefore probably correct.

IN the last number of the German Chemical Society ... are published some recent observations on dipropargyl by ... the discoverer of this curious compound. He describes ... yet in any detail, a solid polymer produced by the action ... on dipropargyl. He also describes the tetriodide $C_6H_4I_4$, ... the octobromide $C_6H_6Br_8$.

THE arguments in favour of the number 240 being ... the atomic weight of uranium have been strengthened ... preparation by C. Zimmermann (*Berliner Berichte*) of the ... uranate of lithium, Li_2UO_4, analogous with the normal ... mates, tungstates, and molybdates.

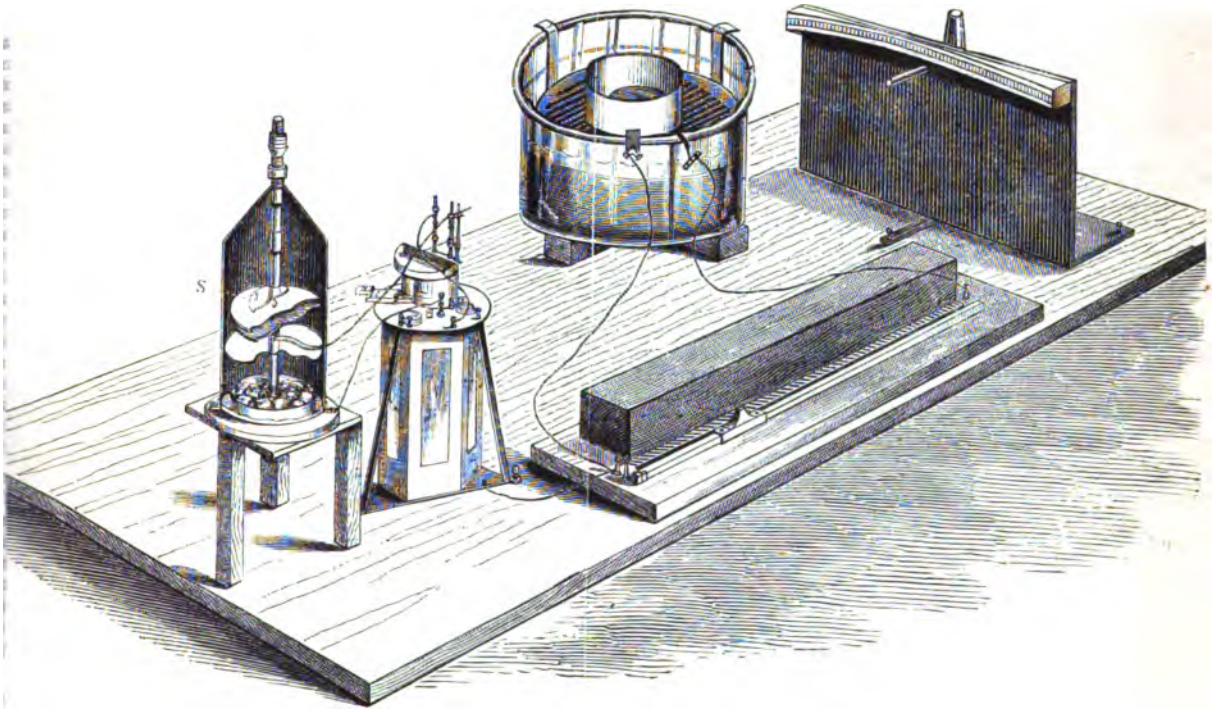
IN the *Chem. Soc. Journ.* for March Dr. Ramsay ... his investigations on atomic and molecular volumes; he ... evidence in support of the number 7 as representing ... atomic volume of nitrogen; the generally-accepted number ... 2·3. He also shows that the molecular volumes of ... of the benzene, naphthalene, and anthracene series are ... than those calculated from the best established atomic ... of the constituent elements, and his numbers suggest that ... condensation in these compounds may very probably be ... tional to the number of carbon atoms in each molecule, ... to the manner of "linking" of these atoms.

N A METHOD OF MEASURING CONTACT ELECTRICITY[1]

r my reprint of papers on electrostatics and magnetism (§ 400, of date January, 1862) I described briefly this hod, in connection with a new physical principle, for exhibit- contact electricity by means of copper and zinc quadrants stituted for the uniform brass quadrants of my quadrant trometer. I had used the same method, but with movable cs for the contact electricity, after the method of Volta, and own quadrant electrometer substituted for the gold-leaf troscope by which Volta himself obtained his electric indi- ons, in an extensive series of experiments which I made in years 1859–61.

was on the point of transmitting to the Royal Society a paper ich I had written describing these experiments, and which I still e in manuscript, when I found a paper by Hankel in Pog- dorff's *Annalen* for January, 1862, in which results altogether ccordance with my own were given, and I withheld my paper I might be able not merely to describe a new method, but if sible add something to the valuable information regarding perties of matter to be found in Hankel's paper. I have de many experiments from time to time since 1861 by the same method; but have obtained results merely confirmatory of what had been published by Pfaff in 1820 or 1821, showing the phenomena of contact electricity to be independent of the surrounding gas, and agreeing in the main with the numerical values of the contact differences of different metals which Hankel had published; and I have therefore hitherto published nothing except the slight statements regarding contact electricity which appear in my "Electrostatics and Magnetism." As interest has been recently revived in the subject of contact electricity, the following description of my method may possibly prove useful to experimenters. The same method has been used to very good effect, but with a Bohnenberger electroscope instead of my quadrant electrometer, in researches on contact electricity by Mr. H. Pellat, described in the *Journal de Physique* for May 1880.

The apparatus used in these experiments was designed to secure the following conditions:—To support two circular disks of metal about four inches in diameter in such a way that the opposing surfaces should be exactly parallel to each other and approximately horizontal, and that the distance between them might be varied at pleasure from a shortest distance of about one-fiftieth of an inch to about a quarter or half an inch. This part of the apparatus I have called a "Volta-condenser." The lower plate, which was the insulated one, was fixed on a glass



em rising from the centre of a cast-iron sole plate. The upper late was suspended by a chain to the lower end of a brass rod liding through a steadying socket in the upper part of the case. stout brass flange fixed to the lower end of this rod bears hree screws, one of which, S, is shown in the drawing, by which he upper plate can be adjusted to parallelism to the lower plate. The other apparatus used consisted of a quadrant electrometer, nd in my original experiments an ordinary Daniell's cell, in my ater ones a gravity Daniell's cell of the form which I described n *Proc.* R.S. 1871 (pp. 253–259) with a divider by which any ntegral number of per cents. from 0 to 100 of the electromotive orce of the cell could be established between any two mutually nsulated homogeneous metals in the apparatus.

Connections.—The insulated plate was connected by a brass vire passing through the case of the Volta-condenser to the lectrode of the insulated pair of quadrants. The upper plate vas connected to the metal case of the Volta-condenser and to he metal case of the electrometer, one pair of quadrants of vhich were also connected to the case. One of the terminals of he divider, which connected the poles of the cell, was connected to the case of the electrometer, and to the other terminal was attached one of the contact wires, which was a length of insulated copper wire having soldered to its outer end a short piece of platinum. The other contact surface was a similar short piece of platinum fixed to the insulated electrode of the electrometer. Hence it will be seen that metallic connection between the two plates was effected by putting the divider at zero and bringing into contact the two pieces of platinum wire.

Order of Experiment.—The sliding piece of the divider was put to zero, and contact made and broken and the upper plate raised: then the deflection of the spot of light was observed. These operations were repeated with the sliding piece at different numbers on the divider scale until one was found at which the make-break and separation caused no perceptible deflection. The number thus found on the divider scale was the number of per cents. which was equal to the contact electric difference of the plates in the Volta-condenser.

[*Addendum*, November 23, 1880.—Since the communicatio of this paper to the British Association, I have found that a dry platinum disk, kept for some time in dry hydrogen gas, and then put into its position in dry atmospheric air in the Volta-condenser, becomes positive to another platinum disk

[1] By Prof. Sir William Thomson, M.A., F.R.S.; being a paper read before Section A of the British Association at Swansea, 1880, with additions.

which had not been so treated, but had simply been left undisturbed in the apparatus. The positive quality thus produced by the hydrogen diminishes gradually, and becomes insensible after two or three days.]

P.S.—On December 24, 1880, one of two platinum plates in the Volta-condenser was taken out; placed in dried oxygen gas for forty-five minutes; taken out, carried by hand, and replaced in the Volta-condenser at 12.30 on that day. It was then found to be negative to the platinum plate, which had been left undisturbed. The amount of the difference was about ·33 of a volt. The plates were left undisturbed for seventeen minutes in the condenser; and were then tested again, and the difference was found to have fallen to ·29 of a volt. At noon on the 25th they were again tested, and the difference found to be ·18. The differences had been tested from time to time since that day, the plates having been left in the condenser undisturbed in the intervals. The following Table shows the whole series of these results:—

Time.	Electric difference between surfaces of a platinum plate in natural condition, and a platinum plate after 45 minutes' exposure to dry oxygen gas.
Dec. 24, 12.30 p.m.	·33 of a volt.
24, 12.47 p.m.	·29 ,,
25, noon	·18 ,,
27, noon	·116 ,,
28, 11.20 a.m.	·097 ,,
31, noon	·047 ,,
Jan. 4, 11.0 a.m.	·042 ,,
11, 11.40 a.m.	·020 ,,

Mr. Rennie, by whom these experiments were made during the recent Christmas holidays, had previously experimented on a platinum plate which had been made the positive pole in an electrolytic cell with an electromotive force of one volt, tending to decompose water acidulated with sulphuric acid; the other pole being a piece of platinum wire. After the plate had been one hour under this influence in the electrolytic cell he removed it, and dried it by lightly rubbing it with a piece of linen cloth. He then placed it in the Volta-condenser, and found it to be negative to a platinum plate in ordinary condition; the difference observed was ·27 of a volt. This experiment was made on October 21; and on November 8 it was found that the difference had fallen from ·27 to ·07. Mr. Rennie also made similar experiments with the platinum disk made the negative pole in an electrolytic cell, and found that this rendered the platinum positive to undisturbed platinum to a degree equal to about ·04 of a volt. The effect of soaking the platinum plate in dry hydrogen gas, alluded to in my first postscript, which also was observed by Mr. Rennie, was found to be about ·11 of a volt. Thus in the case of polarisation by hydrogen, as well as in the case of polarisation by oxygen, the effect of exposure to the dry gas was considerably greater than the effect of electro-plating the platinum with the gas by the electromotive force of one volt.

THE NAVAL ARCHITECTS

THE session of the Institution of Naval Architects just concluded was remarkable for the number of papers on the use of steel both for shipbuilding and marine engineering. This was perhaps to be expected in consequence of the commotion among steel-users caused by the total failure of the steel plates supplied for the boilers of the Russian yacht *Livadia*. Accordingly we find four papers on this subject. The first, by Mr. Samuda, deals with the effect which the introduction of steel hulls and steel-faced armour has had upon the design of ships of war. This paper is based upon the results attained by the author with a steel corvette which he has recently constructed for the Argentine Government. The dimensions of this vessel as actually constructed, and the corresponding dimensions which must of necessity have been adopted, had the material of construction been iron instead of steel, should be carefully noted in order to appreciate the true benefits to be derived from the use of the latter material.

The vessel as actually constructed is 240 feet long by 50 feet wide; the displacement is 4200 tons, the power 4500 horses, and the coal-supply 650 tons, which is sufficient to allow her to steam 6000 miles at a speed of 8 knots, or 4300 miles at a speed of 10 knots. The speed which it is expected will be attained on the measured mile is 13½ knots. If the vessel had been built of iron and cased with iron armour, the speed and shot-resisting power remaining the same, the dimensions would have been as follows:—Length, 260 feet; breadth, 55 feet; [illegible] 5200 tons; power, 5000 horses; and coal-supply, [illegible] This example is a very good illustration of the great [illegible] which naval architects will derive from the use of steel. It should be remarked, which comes most opportunely to [illegible] powerful ordnance; for not only has the steel-[illegible] about 25 per cent. more resisting power than an equal [illegible] of iron, but also the weight saved in the hull and [illegible] the use of steel enables a greater quantity of [illegible] carried.

The second paper on steel was by Mr. W. Pole, [illegible] Engineer Surveyor to Lloyd's Registry, "On the Cause [illegible] Failure of the Steel Plates supplied for the Boilers of the [illegible] Steel, as is well known, had formerly a bad repu[illegible] treachery and uncertainty of behaviour. Lately [illegible] more intimate knowledge of the methods of manufac[illegible] better acquaintance with the processes of working [illegible] quite removed this impediment to its general introduc[illegible] failure therefore above referred to came as a surprise [illegible] builders, and the circumstances demanded and receive[illegible] searching inquiry at the hands of the engineer officers [illegible] It was found that samples cut from the broken plat[illegible] every test demanded by Lloyd's, the Admiralty, and [illegible] of Trade. The tensile strength proved to vary betwee[illegible] narrow limits of 26·1 and 28·3 tons per square [illegible] elongation after fracture of samples 8 inches in leng[illegible] from 27·3 to 34·3 per cent. Nevertheless in spite of [illegible] rently excellent quality of the plates, it was found that [illegible] had been punched and worked into place they had [illegible] brittle as to be unable to stand the hydraulic proof [illegible] is usual to subject boilers, and in some instances even [illegible] cracked before the hydraulic test was applied. T[illegible] investigations of Mr. Parker proved that wherever [illegible] the plates were punched, the material became so [illegible] break into pieces under the blow of an ordinary sledg[illegible] the tensile strength dropped to 18·4 tons per square [illegible] the extensibility disappeared altogether.

Specimens were next subjected to chemical analysis [illegible] result of proving that, the material was from the che[illegible] of view far from homogeneous. A portion of the pl[illegible] 8 inches long by 4 inches wide, was carefully freed f[illegible] grinding, and successive layers were planed off from [illegible] the other. Each layer was one-sixteenth of an inch [illegible] and they were numbered in succession as they were [illegible] The result of analysis showed that the quantities [illegible] manganese, sulphur, and phosphorus varied in an [illegible] degree. These differences in the chemical compos[illegible] ever, did not satisfactorily account for the behaviour [illegible] It was not till the appearance of the fractures exp[illegible] the material had not been properly worked under [illegible] and rolls, that a really satisfactory solution of the [illegible] arrived at. "A piece cut from the fractured plate was [illegible] red heat and rolled to half its original thickness. [illegible] then cut from this ½ inch plate, and punched with [illegible] diameter, being one half the size of those in the [illegible] This extra work on the material seemed to raise [illegible] appreciably, the strips being found to bend well after [illegible] several of them bending to right angles, and only [illegible] breaking short off, while none of them showed such [illegible] nary signs of brittleness as were observable in the mat[illegible] of the original thickness. Three pieces tested for ten[illegible] after rolling broke under a stress of 33 tons, 34·7[illegible] 32·3 tons per square inch respectively, with an el[illegible] 8 inches of 12 per cent., 11·25 per cent., and 17·5[illegible] respectively, the last-mentioned specimen being annea[illegible]

Mr. Parker concludes his paper by expressing the [illegible] the facts which he was able to lay before the meeting [illegible] to allay alarm and to strengthen confidence in the [illegible] steel for constructive purposes. When it is considered [illegible] enormous quantity of this material is now being used [illegible] struction of marine boilers, as well as for the hull [illegible] this wish will be heartily re-echoed. In the spring [illegible] there were only two marine boilers of the modern Ad[illegible] mild steel in existence. Within twelve months [illegible] that date 120 steamers had been fitted with boiler[illegible] material, and during the same period in the following [illegible] vessels more. At the present moment there are [illegible] 1100 steel boilers in use in steamships, weighing [illegible] 17,000 tons.

eel was by Mr. J. R. Ravenhill, and improvements which have recently been gs. Many portions of machinery and quite recently were invariably made of rmed of cast steel, with the attendant ngth and saving in weight.

resting paper of the four was that by e eminent French naval architect, "On for the Construction of the Hulls of avy." The French were undoubtedly this material into the national navy; ence of it is longer than our own, acquired the same confidence in its use country. For instance, we are in the e entire hulls of ships, including the steel; the French, on the other hand, ll work which has to be exposed to the e reason advanced is that they find that salt water corrodes with far greater Berrier Fontaine quotes as examples nd the *Tromblon*, the hulls of which, have both given proof of rapid and *Tromblon* was launched at Toulon on emained afloat till October 27 of the period of nine months it was found ree times, that it is to say, about every e hull, the plates being rapidly and ly in the neighbourhood of the water- is corrosion went on with such unusual ase came to pass the *Tromblon* into the essary to haul her on to a ship instead The whole subject of the corrosion of involved in great mystery, and no two gree about the cause. In the English believed that it is due to the presence es of portions of black oxide, which o many active galvanic couples, which te corrosion, and hence great care is traces of this oxide before the plates ay be the cause, it is perfectly certain English builders does not tally with ature in this particular. Certain cases ubt occurred in this country, and the ample in point; but as far as present es are the exception instead of the rule. ves an interesting account of the trials e French dockyards for the working of the early difficulties which the work- hich have been successfully overcome. of manufacture adopted in France, it results are obtained from the Bessemer s, so much so that when contracts are fied that the material is to be prepared ocesses. In some works the Siemens the superior sorts of steel, and the l for inferior descriptions, such as rails, tly the opposite takes place. In this , it is almost universally the rule to ces for the production of mild steel al for boiler purposes.

ND MOVING SANDS

ade to the Russian Society of Natu- has given a description of the dunes is-touryetsk, at the eastern end of the hole of the isthmus between the Gulf etsk is covered with dunes which have which are close by the sea-shore are overed with vegetation, parallel to one the form of a straight line, while those east are true dunes, built up of sand y have the direction north and south, of a hundred feet. Several of them e-forests and with moss, while others The latter are constantly brought into and south of the Sestra River a high e houses of the working men of the r. This dune, about 700 feet broad, al houses, and it is always advancing further, forming smaller parallel dunes fifteen feet high; its western side is covered with numerous excavations, from which the wind has taken the sand to move it further east. M. Sokoloff, while agreeing with the well-known classification of dunes established by the explorer of Sahara, M. Vatonne, thinks that the dunes of the deserts, which owe their origin to the action of wind, might be very easily distinguished from the mostly lower ridges which appear on the sea-shores under the influence of waves, these last usually having the form of straight lines, whilst the true dunes always have a semicircular form. M. Severtzoff observed after this communication that in the steppe of Kyzyl-koum, true dunes often have the same form of parallel, quite straight ridges. However, having at their origin a circular form which is so characteristic of the *barkhani* of the steppe, they lose by and by this form, and several smaller dunes, uniting together at their ends, take the form of a long straight ridge perpendicular to the prevailing direction of wind. M. Moushketoff, who has made a close acquaintance with the sands of Central Asia, observed that these sands, which are all sporadic, being spread among older formations, are very different as to their extent, their stratigraphical and petrographical characters, and their origin. They might be subdivided into three different classes:—1. Those which have a marine origin and which might be observed on the south-eastern shores of Lake Aral, and especially in the Kara-koum steppe. They are about 250 yards and 70 feet high, and mostly parallel to the shore. They are typical marine dunes, but their extension closely depends upon the extension of the Aralo-Caspian formation, the fossils of which are always found broken in these sands. 2. The fluvial dunes, which are very common in the valleys of the Amou, Syr, Sourkhan, and others; their height rarely exceeds 10 to fifteen feet, and their length is from 100 to 150 feet; their sand is steel-gray, and contains gypsum and clay. 3. The *barkhani* are subaerial formations; they prevail in the central part of the steppe Kyzyl-koum, but are rather rare in the Kara-koum steppe. They have the form of a sickle, and are somewhat conical, their maximum height being as much as 20 to 30 feet; their slopes are very different, that which is under the influence of the wind having an inclination from 5 to 13 degrees, whilst the other slope is short and steep, the inclination reaching sometimes as much as 45 degrees; they consist of a dirty-yellow or red sand, owing to their origin in the Tertiary sandstone, or sometimes in other harder rocks, as for instance, in the valley of the Ili River. Sometimes typical *barkhani* are met with among dunes, being a secondary formation arising out of the marine dunes. As to the plantations of trees on dunes, M. Moushketoff thinks that it would be far more rational first to determine whence the sand is brought by the wind, and to make the plantations of trees or bushes, according to the chemical character of the sand on this place, instead of making them on the dunes themselves.

UNIVERSITY AND EDUCATIONAL INTELLIGENCE

MANCHESTER.—We learn that the Council of the Owens College proposes shortly to establish an independent Chair of Applied Mathematics.

EDINBURGH.—The tercentenary of the University of Edinburgh will be celebrated in 1883. The senatus are to invite representatives from other universities to be present; they also propose to bring out a history of the University during the first 300 years.

THE winter session of the College of Agriculture, Downton, Salisbury, was brought to a close on Wednesday, when the prizes were presented by Earl Nelson, who dwelt at considerable length on the present state and future prospects of British agriculture, taking a very hopeful view of the latter. The High Sheriff of Wilts warmly advocated such a combination of science with practice as was in vogue at the College. The Scholarship offered for competition amongst students who have completed their first year at the College was awarded to Mr. Louis Johnstone, son of Sir Harcourt Johnstone, Bart., Hockanss Hall, Scarborough, the Hon. Victor A. N. Hood *proxime accessit*.

SOCIETIES AND ACADEMIES

LONDON

Royal Society, March 31.—"Permanent Molecular Torsion of Conducting Wires produced by the Passage of an Electric Current," by Prof. D. E. Hughes, F.R.S.

In a paper on "Molecular Electro-Magnetic Induction," presented to the Royal Society (March 7, 1881, I gave a description of the induction currents produced by the torsion of an iron wire, and the method by which they are rendered evident. The electro-magnetic induction-balance there described is so remarkably sensitive to the slightest internal strain in anywise submitted to it, that I at once perceived that the instrument could not only determine any mechanical strain such as torsion or longitudinal stress, but that it might indicate the nature and cause of internal strains. Upon putting the question to it, Does the passage of electricity through a wire produce a change in its structure? the answer came, It does, and that to a very considerable extent; for an iron wire adjusted to perfect zero, and which would remain free from any strain for days, becomes instantaneously changed by the first passage of a current from a single cell of a Daniell's battery; the wire has now a permanent twist in a direction coinciding with that of the current, which can be brought again to zero by mechanically untwisting the wire, or undoing that which the passage of electricity has caused. Before describing the new phenomenon, I will state that the only modification required in the apparatus is a switch or key by means of which the telephone upon the wire circuit is thrown out of this circuit, and the current from a separate battery of two bichromate cells passed through the wire alone, at the same time, care being taken that no current passes through the coil, but that its circuit should remain open during the passage of the electric current through the wire under observation; an extra switch on this circuit provides for this. The reason for not allowing two currents to react upon each other, is to avoid errors of observation which may be due to this cause alone. When, however, we take an observation, the battery is upon the coil and the telephone upon the wire alone. An experiment thus consists of two operations. First all external communications interrupted, and an electric current passed through the wire; and, second, the electric currrent taken off the wire, and all ordinary communications restored. As this is done rapidly by means of the switches, very quick observations can be made, or if desired the effects of both currents can be observed at the same instant.

Now if I place upon the stress bridge a soft-iron wire ⅛ millim. diameter, 25 centims. long, I find, if no previous strain existed in the wire, a perfect zero, and I can make it so either by turning it slightly backwards or forwards, or by heating the wire to a red heat. If I now give a torsion of this wire, I find that its maximum value is with 40° torsion, and that this torsion represents or produces electric currents whose value in sonometric degrees is 50; each degree of torsion up to 40 produces a regular increase, so that once knowing the value of any wire, we can predict from any sonometric readings the value in torsion, or the amount of torsion in the opposite direction it would require to produce a perfect zero.

If now I place this wire at zero, and thus knowing that it is entirely free from strain I pass an electric current through it, I find that this wire is no longer free from strain, that it now gives out induction currents of the value of 40, and although there is no longer any battery current passing through this wire that the strain is permanent, the outside coil neither increasing nor diminishing the internal strain it has received by the passage of an electric current through the wire; upon giving a torsion to the wire in one direction, I find the inductive force increase from 40 to 90, but in the other direction it is brought to zero, and the amount of torsion, some 35°, required to bring the wire again to zero represents exactly the twist or strain that had been produced instantaneously by the passage of an electric current. If I repeat the experiment, but reverse the battery current sent through the wire, I find an opposite twist of exactly the same value as previously, and that it now requires an opposite torsion to again bring the wire to zero. It is not necessary however to put on an equal opposite torsion on wire to bring the currents to zero, for as I have shown in my late paper, the sonometer not only allows us to measure the force and indicate its direction, but allows us to oppose an equal electric current of opposite name, thus producing an electrical zero in place of the mechanical one produced by torsion.

Evidently here there has been a sudden change in the structure of the wire, and it is a twist which we can both measure and reproduce. The question at once becomes, Has a molar twist been given to the wire such as would be detected by the arm or free end of the wire, or a molecular change leaving no trace upon its external form of what has passed?

It will be found that, notwithstanding that it requires some 40° of torsion to annul the effects of a passage of an electric [illegible] no visible movement nor any tendency of the free end [illegible] in the direction of the twist it has received can be observed believe however to have noticed a slight tremor or movement half a degree, but as I could not always reproduce it, and [illegible] so slight compared with the 40° of internal twist, I [illegible] taken it into account, for if the wire is firmly fastened [illegible] ends no molar torsion being possible, except an elastic [illegible] which would instantly spring back to zero, the current once [illegible] produces its full effects of twist and it is permanent. The molecules have in some extraordinary way rearranged themselves into a permanent twist, without the slightest external evidence of so great a change having taken place. An equally remarkable change takes place in aid of, or against (according to direction of current) an elastic permanent strain. Thus, if I first put the wire under 40° right-handed permanent torsion, I find its value is 50. Now, passing the positive of battery through its fixed and negative to fixed end, the induction currents rise at once to value to 90; if, now, the negative is momentarily passed to the free end and positive to fixed end the induced currents at once fall to 10, and these effects remain, for on taking off the elastic torsion the wire no longer comes to zero, but has a twist value produced by the current.

Tempered steel gave only one or two degrees against the soft iron, but supposing this might be due to its greater rigidity, I carefully brought the wire to zero, and then with the first contact only. I found then that the first contact gave a value of 40, but the second and following only one or two. On bringing the wire back to zero by a momentary touch of the magnet a continued force of 40, or if constant reversals were used instead of a simple contact, there was constant production of similar great molecular change by the passage of a current in steel as well as iron.

I can find no trace of the reaction of the wire upon the magnetism of the earth, as in all positions the same degree of zero was obtained, if great care is taken that the wire is absolutely free from longitudinal magnetism; there is however a slight reaction upon its own return wire if brought within a certain distance of the wire, and this reduces the twist some 10°. The maximum effects are obtained when the return wire is at more than 25 centims.; thus the action is not one produced by reaction, but by direct action upon its internal structure.

Copper and silver wires so far show no trace of the action. I believe, however, that a similar strain takes place in all cases, and I have obtained indirectly indications of this fact; I hope however, to verify this, would require a different mode of observation from the one I have described, and I have not yet perfected the apparatus required.

It seemed probable that if I approached a strong permanent magnet to the wire, I should perceive a twist similar to that produced by the passage of a current; but no such effect can be observed. But it has a most remarkable effect of the kind in bringing to zero a strain produced by the current, and to a wire which pole, the effect was the same. Thus, a strain of 40° which remains a constant, instantly disappears upon the presentation of longitudinal magnetism, and I have found this method of reducing an iron wire to zero of strain far more effective than any other method yet tried, such as vibrations, heat, [illegible]

It will be seen from this that the molecular arrangement up by magnetism is very different from that produced by the passage of an electric current. It evidently has a strength its own, else it would not have instantly destroyed the strain left by the passage of electricity if it had not taken new form, as rendered evident in the longitudinal magnetism which we could at once perceive on the wire. This point, however, belongs to a separate investigation, and I hope apparatus will aid me later in throwing some new light this subject.

Another method of reducing the wire to zero, after the passage of a current, is to keep the wire in a constant state of vibration. It requires in time about one minute to bring it to zero, but on the contrary, I set the wire vibrating during the passage the current, the permanent twist becomes greater and more difficult to reduce to zero.

If a wire which has internal strains is heated to redness the strains almost entirely disappear, and I can thus reduce by heat a strain which a current had produced, but heat, whilst allowing greater freedom and motion of its molecules, does not produce an internal strain being set up, for whilst heat can reduce the wire to zero, after the passage of the current, the effect is increased. If, during the time that the wire is at a red heat

t is passed in the same time, and at the same instant we ff the current and the external heat, the wire when cold : found to have a higher degree of strain than previously le with the wire when cold.

have seen that both mechanical vibrations and heat can : the wire to a zero, but its action is very slow, several es being required; but the action of electricity in producing manent twist is exceedingly quick. I have found that a contact, whose duration was not more than 0·01 of a l, was equal to that of a prolonged contact of several es, and magnetism was equally as quick in reducing this to zero. And it is the more remarkable when we con the very great mechanical force required by torsion of the to untwist the strain produced in an instant of time by icity.

e results I have given are those obtained upon soft iron of ½ millim., but I have experimented with different sizes 3 millims. diameter. The results with 1 millim. diameter quite as evident as the ½ millim., but on the 3 millim. wire rain was reduced to 25° instead of 50°, owing to the extreme ity and low electrical resistance compared with my small ry wires. On a telegraph line, the wire of which is almost ely of iron, there must be a very great strain set up, which ver would remain a constant, except where reversed currents sed, and in this case a constant movement of the molecules e wire must be the result.

believe it to be most important that we should determine, as s we can by experimental research, the nature of all mole- changes produced by electricity and magnetism, and in this f I am happy in being able to bring this paper before the al Society.

hemical Society, April 7.—Dr. Russell in the chair.—The wing papers were read:—On the organic matter in sea- r, by W. Jago. The author concludes that the organic ter of sea-water is much more capable of resisting oxidising ts than that present in ordinary fresh water, and that it is bably organised and alive.—On the action of compounds ical to bacterial life, by W. M. Hamlet. The cultivating ls used comprised Pasteur's fluid, beef tea, hay infusion, e, brewer's wort, and extract of meat; these were sterilised oiling for ten minutes in Pasteur's flask, cooled with suitable autions, and then seeded with hay solution, and the sub- ce under examination added. Many gases, &c., were tried. orine and hydric peroxide were fatal to bacteria, while chloro- n, creosote, carbolic acid, salicylic acid, &c., hindered their elopment, but did not destroy them.

nthropological Institute, March 22.—F. W. Rudler, .S., vice-president, in the chair.—The election of George Waterhouse was announced.—Mr. R. W. Felkin exhibited a es of photographs of scenes and natives of Central Africa, en by Herr Buchta.—Prof. Flower, F.R.S., exhibited a col- ion of crania from the Island of Mallicollo in the New brides, which had been lately presented to the Museum of Royal College of Surgeons by Mr. Luther Holden. The uliar conformation of the heads of the people of this island racted the attention of Capt. Cook and the naturalist Forster, o accompanied the great navigator on his second voyage, and o writes that "the depressed and backward inclining forehead ises an appearance in the looks and countenances of the tives similar to those of monkeys." Yet Cook bears testi- ny to the activity, intelligence, and honesty of this "ape-like ion," as he calls them. A few years ago Mr. Busk described ne skulls collected in the island by the late Commodore odenough, and found that they all showed signs of having dergone alterations in form from pressure applied in infancy. e present collection corroborates Mr. Busk's views; some of skulls being deformed to a remarkable degree, and closely embling the well-known Peruvian crania from the neighbour- od of Lake Titicaca. This is the more remarkable, as on no other the numerous islands of the neighbouring ocean is the prac- e known to exist. Besides the deformed crania the collection ntained several monumental heads, said to be those of chiefs. these the features are modelled in clay upon the skull, appa- ntly with the intention of preserving a likeness of the dead rson; the face is painted over with red ochre, artificial eyes troduced, and the hair elaborately dressed and ornamented ith feathers. In one case the hair had been entirely removed, d a very neatly-made wig substituted. The head thus pre- ared is stuck upon a rudely-made figure of split bamboo and ay, and set up in the village temple, with the weapons and small personal effects of the deceased. This is a custom not hitherto known to exist among the Mallicollese, and its motive is not completely understood, but it is obviously analogous to many others which have prevailed throughout all historical times and in many nations, manifesting itself, among other forms, in the mummified bodies of the Ancient Egyptians and the marble busts over the mouldering bones in Westminster Abbey.—Mr. Joseph Lucas read a paper on the ethnological bearings of the terms Gipsy, Zingaro, Rom, &c.

Zoological Society, April 5.—Prof. W. H. Flower, LL.D., F.R.S., president, in the chair.—Mr. Sclater exhibited five bird's skins obtained by the Rev. G. Brown, C.M.Z.S., on the Island of Rotumeh, and presented by him to the *Challenger* Expedition. Mr. Sclater also exhibited specimens of two new species of birds from New Britain, belonging to the Museum Godeffroi, which he proposed to call *Trichoglossus rufigularis* and *Ortygocichla rubiginosa*.—Mr. H. E. Dresser exhibited and made remarks on a specimen of *Saxicola deserti* killed in Scotland, and a specimen of *Picus pubescens* believed to have been killed in Normandy.—Mr. W. A. Forbes, F.Z.S., read some notes on the external characters and anatomy of the Californian Sea Lion (*Otaria gillespii*), and exhibited some coloured drawings of this animal.—Prof. Flower, F.R.S., read a note upon the habits of the Manatee, chiefly in reference to the question as to whether this animal had the power of voluntarily leaving the water for the purpose of feeding on the herbage of the banks, as stated by many authors, and as supported by a communication from the late Mr. R. B. Dobree, notwithstanding which Prof. Flower considered the evidence upon which the statement was based to be very unsatisfactory.—A paper was read upon the same animal by Miss Agnes Crane, consisting of observations upon the Manatees lately living in the Brighton Aquarium.—Dr. A. Günther, F.R.S., read an account of the Amphisbænians and Ophidians collected by Prof. Bayley Balfour in the Island of Socotra. A new form of snakes allied to *Tachymenis* was named *Dityophis vivax*, a new species of *Zamenis* was named *Z. Socotræ*, and a new form of Amphisbænian *Pachycalamus brevis*.—Mr. W. T. Blanford, F.R.S., gave an account of six species of lizards which had been collected by Prof. Bayley Balfour in Socotra; of these the three following appeared to be undescribed:—*Hemidactylus homœolepis*, *Pristurus insignis*, and *Eremias Balfouri*.—Mr. Charles O. Waterhouse read a paper on the coleopterous insects which had been collected by Prof. Bayley Balfour in Socotra. The number of species of which examples were collected was twenty-four, and showed that the fauna of Socotra, judging from this collection, was distinctly African. Twelve of the species appeared to be new.—A communication was read from Prof. J. O. Westwood containing observations on two species of Indian butterflies, *Papilio castor* and *P. pollux*.—A communication was read from Mr. Edgar A. Smith, containing some observations on the shells belonging to the genus *Gouldia* of C. B. Adams.—Mr. Sclater read the fifth of his series of notes on the birds of the vicinity of Lima, Peru, with remarks on their habits by Prof. Nation, C.M.Z.S. A new species of *Buarremon*, of which an example was in the collection, was proposed to be dedicated to its discoverer as *B. Nationi*.—Mr. G. E. Dobson read some notes on certain points in the muscular anatomy of the Green Monkey, *Cercopithecus callithrix*.

EDINBURGH

Royal Society, March 21.—Sir Wyville Thomson, vice-president, in the chair.—Prof. Geikie communicated a paper by Mr. C. A. Stevenson, B.Sc., on the earthquake of November 28, 1880, in Scotland and Ireland. The main conclusions at which the author arrived were the following:—The centre of the disturbance was at a point some thirteen miles south-west of Fladda, in the continuation of the line of the fault that lies along the great glen which stretches in a south-westerly direction from Inverness. The disturbance was felt over an area of 19,000 square miles, extending as far east as Blair Athole, as far north as the Butt of Lewis, and as far south as Armagh in Ireland. The undulation was everywhere of an up-and-down character; its breadth was estimated at 1100 feet, and its velocity seemed to vary from 3·75 to 7·75 miles per minute, having a mean value of 6·75 over the sea and 4·68 over the land. The accompanying rumbling was not heard at all the stations, and appeared to have been best heard where but little soil covered the hard dense substratum of rock. The disturbance was felt better over the older rocks. Noises were not heard outside a radius of 38 miles from the centre, except in the north of Ireland, where however it was

suggested that the noise was due to the indirect action of the earthquake in causing a secondary local disturbance.—Mr. P. Geddes read his first communication on the classification of statistics. After pointing out the utter confusion that exists in many of the national classifications of the present time, the author criticised the arrangements suggested by Deloche and Mouat, which were equally unsatisfactory, because of their unscientific and artificial methods. Any classification, to be natural, must be based upon some broad principle common to all kinds of communities or societies. A fundamental meaning must therefore be attached to the word society—a definition given to it that will include societies of all kinds of organisms. Such a definition must obviously take account of the vital functions of organisms in relation to the matter and energy of the universe. We have thus matter and energy on the one hand, organisms on the other. Mr. Geddes, confining himself meanwhile to the first of these two great divisions, proceeded to classify the sources of energy, adopting the classification given by Prof. Tait in his Thermodynamics, and showing how naturally such things as food, fuel, machines, &c., fell into their places in such an arrangement. He then considered the classification of sources of matter used for other than energy-properties, taking for this purpose the well-known three-fold division into minerals, vegetables, and animals. The development of ultimate products through their successive phases of raw material, manufacture, exportation, trade, &c., and the classification of all products under the three chief headings of potential, mediate, and ultimate, completed the one aspect of the statistical method in so far as it related to the matter and energy of the universe. It still remained however to take account of the loss, or more properly the degradation or dissipation, suffered. The classification must indicate not only the kind of loss, *e.g.* whether in raw material, in manufacture, in trade, in ultimate product, or in remedial effort, but also the agency that was the direct cause of the loss, whether physical, as earthquake, flood, storm, &c.; or biological, as insects, fungi, &c.; or social, as crime, war, or folly.—Mr. T. Muir communicated three mathematical notes: on Prof. Cayley's theorem regarding a bordered skew determinant; on the law of extensible minors in determinants; and on a problem of arrangement.—Mr. J. Y. Buchanan read a short paper on the oxidation of ferrous salts.—Prof. Tait made a brief communication on some space loci.

PARIS

Academy of Sciences, April 4.—M. Wurtz in the chair.—M. de Quatrefages presented an example of the Edwards Medal.—The following papers were read:—On micrometric measurements during the transit of Venus of 8 December, 1874, by M. Puiseux. These measurements (393 in number and in five categories) at St. Paul and Pekin fairly agree, though the conditions were unfavourable, and give for the parallax 9″·05.—On the same subject, by M. Mouchez. He considers the method is to be strongly recommended for 1882.—Note on the methods of Wronski, by M. Villarceau.—On photographic photometry and its application to study of the comparative radiating powers of the sun and of stars, by M. Janssen. A shutter with triangular aperture is made to pass with uniform motion of known rate before a sensitised plate; this gives (with light) a series of shades on the plate, decreasing from the base side to the apex side. To compare the sensibility of two plates, differently prepared, or the photogenic intensity of two sources (using two like plates) the points of equal shade on the plates are noted. (The photographic intensity does not increase as rapidly as the luminous intensity.) For the sun he finds the time of action (with gelatine bromide of silver plates) must be reduced to $\frac{1}{1000}$ sec. to give the most rapid variation in the opacity. The sides of the slit are curved (for a special reason). A series of circular images of stars are obtained by putting the plate a little out of focus.—On alcoholate of chloral, by M. Berthelot.—On lightning flashes without thunder, by M. d'Abbadie. He observed such quite near, in a fog, when in Ethiopia.—On the combinations of phtalic anhydride with hydrocarbons of the benzene series, by MM. Friedel and Crafts.—Note on chalcomenite, a new mineral species (selenite of copper), by MM. des Cloizeaux and Damour. This is from near Mendoza in the Argentine Republic.—Researches on changes of state near the critical point of temperature, by MM. Cailletet and Hautefeuille. By colouring carbonic acid the liquid is rendered always visible. It is found that Andrews's undulatory striæ dissolve blue oil of galbanum, so that they are produced by streaks of liquefied carbonic acid. Neither in disappearance of a meniscus through compression, nor in change of state at the critical temperature does matter pass by imp[erceptible] the liquid to the gaseous state.—Magnetic [pro]iron of Santa Catharina, by Prof. Lawr[ence] fragments are very feebly affected by a m[agnet] been flattened on a steel surface with a stro[ng] red hot.—Attenuation of effects of virulen[ce] of small quantities of virus, by M. Chauv[eau] elected Member in Geometry in room of th[e] On the winter egg of phylloxera, by M searches on the causes which enable the vin[e] in sandy soils, by M. Saint-André. Weak a soil seems to be the direct or indirect cau[se] vines.—On the bismuthine produced by c[ar] M. Mayençon.—On functions proceeding f[rom] by M. Halphen.—On a new application properties of Fuchsian functions, by M. Fo[ur] tions between solar spots and magnetic va[r] Tables for 1880 are given. The solar curv[e] quickly rising again; a maximum may be ex[pe] The increase of magnetic declination for formula, 0°·99 by observation.—On the Mr. Crookes.—Luminous intensity of incandescent platinum, by M. Violle. ranging from 775° to 1775° he constructs change of volume accompanying the galva by M. Bouty. It is always possible in el salt to diminish the intensity of current be[yond] that the compression produced by the de into attraction (the metal dilating inst[ead] solidifying).—On the voltaic conductivit[y] M. Blondlot. He describes an experim[ent] putting the conductivity of gases beyond parts of the apparatus are constantly op[erated] the internal discharges of electric conde[nser] The laws of the phenomenon are enu[nciated] mirrors, by M. Laurent. A common thickness may be rendered magical by applying the end of a heated brass tube the tube is imaged.—On hydrosulphite of berger.—On some new processes of dess[ilvering] solutions, by M. Scheurer-Kestner.—On tals of lead chambers, by M. Sulliot. Fo[rmation] he places in them porous vessels contai[ning] acid, and to attenuate the irritating acti[on] vessel is placed in another containing eth[er] ease odorous gases are drawn through a [tube] ened with nitrous sulphuric acid.—On amylamines from the active amylic alcoh[ol] Mr. Plimpton.—Action of perchloride o[f] tylic aldehyde, by M. Œconomides.—P[repa]acetal, by the same.—On the products phony, by M. Renard.—Artificial repr[oduction] dolerites, and meteorites of ophitic stru[cture] and Levy.—On the Devonian formation Gilly (Saône-et-Loire), by M. Jullien.

LIGHTNING CONDUCTORS.

Experience, accumulated since the time of Benjamin Franklin, proves conclusively that a Conductor made of Copper of adequate size is the best of all appliances for the protection of every description of building from the destructive effects of lightning.

NEWALL & CO.'S

PATENT COPPER LIGHTNING CONDUCTOR,

As applied to all kinds of Buildings and Shipping in all parts of the world with unvarying success; is the most Trustworthy, most Effective, and also the Cheapest Conductor ever offered to the public.

It is simple in its application, no insulators being required, and it costs only one shilling per foot for the standard size, which ensures safety in any form.

FLETCHER'S
PATENT VENTILATED
HOT-AIR OVEN.

At a cost of less than one halfpenny per hour for gas this oven will grill, roast, toast, bake, warm dishes and plates; and with the assistance of Fletcher's Patent Solid Flame Boiling Burners will do everything possible with a first-rate open fire (except drying clothes on washing days).

It is unapproached by any oven for pastry, and is fully hot in one minute after the gas is lighted.

Fish, joint, and pastry can be cooked all at once, in the most perfect manner, without the slightest taint from one to the other. The cooking is always good and always alike.

It will roast joint and fowls both at once, at least as well as an open fire.

Complete illustrated list of gas cooking and labour-saving appliances free by post. List of Gas and Petroleum Laboratory Furnaces and Apparatus, price 2d.

THE HOUSTON BOTANICAL MICROSCOPE.

This ingenious and efficient little instrument provides botanical students with a dissecting microscope at a very low price.

It consists of a lens contrived so that it will form a dissecting stage; a duplex lens giving 3 powers, 4, 6, and 12 diameters, which can be removed and carried in the pocket, and a brass focussing tube on pillar; a cork slide, a hollowed glass for holding liquids, and a pair of forceps.

PRICE COMPLETE, 6s. 6d.

NEW EDITION, 1880, NOW READY.

EDMUND WHEELER, 48a, Tollington Road, Holloway, London, N.

ST. THOMAS'S HOSPITAL MEDICAL SCHOOL,

ALBERT EMBANKMENT, S.E.

The SUMMER SESSION will commence on May 2nd. Students entering in summer are eligible to compete for the Natural Science Scholarships of £100 and £60 awarded in the following October.

Special Classes are held for the Matriculation, Preliminary Scientific, and 1st M.B. of the University of London.

There are numerous Prizes and Scholarships, and all Appointments are open to Students without extra payment.

Several Medical Practitioners and Private Families in the neighbourhood receive Students for residence and supervision, and a register of inspected lodgings is kept in the Secretary's office.

Prospectuses and all particulars may be obtained from the Secretary, Dr. Gillespie.

W. M. ORD, M.D., Dean.

THE MIDDLESEX HOSPITAL MEDICAL SCHOOL.

SUMMER SESSION, 1881.

Lectures and Clinical Instruction in the Wards will commence on May 2nd. Gentlemen can enter to any one Course or to Hospital Practice only.

TWO ENTRANCE SCHOLARSHIPS, of the annual value of £75 and £20 respectively, tenable for two years, and a SCIENCE SCHOLARSHIP value £50, will be offered for competition at the beginning of the Winter Session.

For Prospectus, containing particulars as to other Scholarships, Resident Appointments, Fees, &c., apply to the Dean or the Resident Medical Officer, at the Hospital.

ANDREW CLARK, Dean.

CITY AND GUILDS OF LONDON INSTITUTE for THE ADVANCEMENT OF TECHNICAL EDUCATION.

VICE-PRESIDENTS.

The Right Hon. Lord SELBORNE, Lord Chancellor, Chairman of Council
F. J. BRAMWELL, Esq., F.R.S., Chairman of Executive Committee.
Sir S. H. WATERLOW, Bart., Ald., M.P., Treasurer.

The Executive Committee are prepared to grant a limited number of

FREE ADMISSIONS

to the Classes in CHEMICAL TECHNOLOGY (Bread-making, Brewing Alkali Trade, Soap, Glass, &c.) in MECHANICAL TECHNOLOGY (Iron and Steel Manufacture, Strength of Materials), under Professors GRAHAM and KENNEDY, at University College; and also to the Classes in METALLURGY (Assaying, Quantitative Blowpipe Analysis, Metals and their Alloys), and in PRACTICAL FINE ART, under Professors HUNTINGTON and DELAMOTTE, at King's College.

In the selection of Candidates preference will be given to Foremen in Chemical Works, Artisans, Apprentices, Designers, and Artistic Tradesmen.

Applications for admission to be sent in the first instance to the Director and Secretary of the City and Guilds of London Institute, from whom, as well as from the Professors at University College and King's College, further particulars can be obtained.

PHILIP MAGNUS, Director and Secretary.

Gresham College, E.C.

THE COUNCIL OF FIRTH COLLEGE,

SHEFFIELD, intend to APPOINT a PRINCIPAL, who shall also be Professor either in the Literary or in the Mechanical Department of the College.

These Departments will comprehend respectively the following Subjects:—

1. Classics, History, Literature, Political Economy, Moral Science.
2. Mathematics, Mechanics, Engineering, Geology, Physics.

Applicants are requested to state in which of these Departments they would be prepared to act as Professor, and which of the Subjects in that Department they would be prepared to undertake.

The Salary of the said Principal will be £500 per annum, with Half the Fees of his own Classes.

The Council will only make the Appointment in event of suitable Candidates presenting themselves.

Candidates are requested to give full particulars concerning Age, Experience, and any Academical Distinctions they may have gained, together with any other information likely to affect the decision of the Council. The names of three gentlemen to whom references may be made should be given, but no testimonials need be sent unless they are asked for.

Applications to be sent on or before the 25th day of April next, to

ENSOR DRURY, Registrar.

Firth College, Sheffield, March 24, 1881.

CHEMISTRY.—Instruction given in Analytical and General Chemistry and Microscopy. Apply to the PRINCIPAL, The Metropolitan Laboratory, 32, Holborn Viaduct, E.C.

SELENIUM FROM £10 per Kilogram, THORITE from £20 per kilogram, is to be had of Dr. S. R. PALKULL, Stockholm.

"THE ENDOWMENT OF RESEARCH."

See NATURE *of April* 14, 7, *and March* 24.

There may be something profound, of which Dr. Brunton has entirely concealed all conception from the Royal Society, in the fact that the same poisoned blood, after death by torture, remains fluid at Calcutta and coagulates in England. We are informed that the *Crotalus*-poison came from Philadelphia, looking like fragments of dried gum-arabic.

In Experiments III. and IV. two full-grown guinea-pigs, of equal weight, were selected, and into their peritoneal cavities, at 1.52 and at 1.56 p.m., were injected *Crotalus* and *Cobra*-poison, one poison for each. Two pages of notes follow, such as those on the former:—"At 2.42. Sluggish; drags the hind-legs. At 2.58. Weaker; rolls partially over on one side, but can run when roused. At 3.7. Can still be roused; abdomen distended and painful; cries out when it is touched, as though peritonitis were setting in. 3.12. Can be roused with difficulty" . . . "can still stagger a few paces, but co-ordination of muscular power much diminished. 3.30. In violent convulsions. 3.38. Convulsions continue." Then death at 3.55, and electrodes and *post-mortem* carving. The other guinea-pig was lucky enough to die in 21 minutes. The null summary compares the effects of the two poisons:—"There were no very marked differences in the action of the poison in these two cases, except in the energy with which the *Cobra* exceeded the *Crotalus*:—*Crotalus*: twitchings; restless; squeaks; sluggish; ataxy; paralysis; hurried respiration; peritonitis; convulsions. Death in 2h. 3m. Coagulated blood; ecchymosis and extravasation of serous effusion well marked; cord paralysed; muscles retain irritability. *Cobra*: Twitchings; excitement; squeaks; sluggish; ataxy; weakness; paralysis; convulsions. Death in 21 minutes. Spinal cord and nerves paralysed; muscles irritable; heart distended; blood congested; ecchymosis; congestion less than in *Crotalus*." I wonder what definite question is freshly answered or elucidated in all this. It is not pointed out that anything is new, nor that anything is of either theoretical or practical value, in these cruel demonstrations. Five such experiments on guinea-pigs are detailed, all with similar vague results. Then three on rabbits. Then, up to XXVIII., experiments on cats and frogs, comprising vivisections. "Experiment XXVIII. To test the effects of *Cobra*-poison, when swallowed, on the frog. [Can any man assign the exact matter tested?] June 24, 1874. At 2.25 p.m. About one-eighth of a grain of dried *Cobra*-poison was passed down a frog's throat. 2.30. Frog makes violent efforts to vomit; gaping; head thrown back tetanically. 2.34. Bloody mucus vomited with violent efforts"—on which hangs the foot-note:—"This experiment is *especially interesting*, as showing that frogs do occasionally vomit, a fact which has been denied by some physiologists." This, at least, is something new, though not exactly the matter tested. The doctor cleverly places his deadly obstruction on the rails of frog life, and waits behind his tree for the coming smash. Calmly, in that tornado of wreck and agony, he says, "Now for Science!" and picks out his chance discovery. I wonder whether the doctrine that frogs do not vomit cost as much cruelty as this triumphant refutation. "2.50. Moves with difficulty; is becoming paralysed; efforts to vomit continue. 3.0. Much the same. 3.5. Very weak; still tries to vomit. 3.10. Reflex action still well marked." How much torment does that mean? "3 15. Motor nerves apparently quite paralysed. 3.20. Apparent death." Whether it died or no, it did vomit. That immortalises Dr. Brunton. If it does not quite follow that all "frogs do occasionally vomit," this one poisoned and tortured frog did. This page of the *Proceedings* of the Royal Society will never be forgotten. This pet experiment so "*especially interesting*" is talked of already. Was the poison given to the serpent to deaden the pain of its victims, or to enable biologists to inflict random and lingering torture, in order that they may talk Science, which, summed up, amounts to so little, and points the way to less?

ENGLISH MEN OF LETTERS.

Edited by JOHN MORLEY.

*** Upwards of 150,000 Vols. of this series have been sold.

WORDSWORTH. By F. W. H. MYERS.
"Mr. Myers gives us a picture of the man and an estimate of his work which is certainly not inferior to anything that has preceded it."—*Academy.*

LOCKE. By Prof. FOWLER.
"In the case of Locke's biographer we venture to say that Mr. Morley has been exceptionally fortunate. A pen more competent than Prof. Fowler's for this particular work might have been sought, and sought in vain."—*Examiner.*

BYRON. By Prof. NICHOL.
"Decidedly one of the most careful and valuable of the whole series."—*Athenæum.*

POPE. By LESLIE STEPHEN.
"The writer's eminent qualities as a critic, his judgment, his wit, his abundant knowledge of eighteenth-century literature, and his keen enjoyment of literary form, have equipped him handsomely for the task he has undertaken."—*St. James's Gazette.*

COWPER. By GOLDWIN SMITH.
"Mr. Goldwin Smith has sketched, in a few decisive touches, the genius of the poet and weakness of the man."—*Daily News.*

CHAUCER. By Prof. A. W. WARD.
"Far away the best connected account of Chaucer and his works to be found in English."—*Academy.*

BUNYAN. By J. A. FROUDE.
"He has given us a real study of Bunyan's life and character, and at the same time a real study of his books."—*Athenæum.*

SOUTHEY. By Prof. DOWDEN.
"A truly scholarly and delightful monograph."—*Examiner.*

HAWTHORNE. By HENRY JAMES, JUN.
"He has made a careful, conscientious, and even vivid literary portrait, such as few of our own writers could have made."—*New York Nation.*

MILTON. By MARK PATTISON.
"Mr. Pattison's achievement is deserving of high praise. He has put life into old facts, he has taken an impartial estimate of a great man whose name is too often used for purposes of poetry."—*Spectator.*

JOHNSON. By LESLIE STEPHEN.
"The new series opens well with Mr. Leslie Stephen's sketch of Dr. Johnson. It could hardly have been done better, and it will convey to the readers for whom it is intended a juster estimate of Johnson than either of the two essays of Lord Macaulay."—*Pall Mall Gazette.*

SCOTT. By R. H. HUTTON.
"We could not wish for a more suggestive introduction to Scott and his poems and novels."—*Examiner.*

GIBBON. By J. C. MORISON.
"As a clear, thoughtful, and attractive record of the life and works of the greatest among the world's historians, it deserves the highest praise."—*Examiner.*

SHELLEY. By J. A. SYMONDS.
"The lovers of this great poet are to be congratulated at having at their command so fresh, clear, and intelligent a presentment of the subject, written by a man of adequate and wide culture."—*Athenæum.*

HUME. By Prof. HUXLEY, F.R.S.
"It may fairly be said that no one now living could have expounded Hume with more sympathy or with equal perspicuity."—*Athenæum.*

GOLDSMITH. By WILLIAM BLACK.
"Mr. Black brings a fine sympathy and taste to bear in his criticism of Goldsmith's writings"—*Athenæum.*

DEFOE. By W. MINTO.
"Mr. Minto's book is careful and accurate in all that is stated, and faithful in all that it suggests."—*Athenæum.*

BURNS. By Principal SHAIRP.
". . . None of the series has given a truer estimate either of character or of genius than this volume."—*Spectator.*

SPENSER. By the Very Rev. the DEAN OF ST. PAUL'S.
"Dr. Church is master of his subject, and writes always with good taste."—*Academy.*

THACKERAY. By ANTHONY TROLLOPE.
"Mr. Trollope's sketch is excellently adapted to fulfil the purpose of the series in which it appears."—*Athenæum.*

BURKE. By JOHN MORLEY.
"It is no disparagement to the literary studies already published in this admirable series to say that none of them have surpassed, while few have equalled, this volume on Burke."—*British Quarterly Review.*

*** *Others in Preparation.*

ZOOLOGICAL CLASSIFICATI
Handy-Book of Reference, &c. By FRANCIS P
Second Edition, with Additions and a Glossary.
JOHN VAN VOORST, 1, Paternoster Row.
"We know of no volume which, in the space, contains
information."—*Nature* (1st Ed.).
"It is rare for any one to go through so much thought
involved in a classification of the genera of the animal
for this to be accomplished by a naturalist whose judgment
by thraldom to theories."—*Westminster Review* (1st Ed.).
"An extremely valuable compendium of zoology."—
Review.
"Notwithstanding the extreme conciseness with which
is treated, the author generally indicates not only the
ing points in the structure, habits, or development of the
which the different groups are to be distinguished, but also
them, and, not content with merely mentioning the
he adopts, usually, in cases of doubt, or where different
discusses briefly the opinions he has not followed."—*Annals*
of Natural History.
"We cordially recommend the work as likely to
service as 'a handy-book of reference.'"—*Edinburgh*
Magazine.

Soon afterwards, by the ph Banks, president of the his sister relates, obtained

from p. 455

"the promise that 2000*l.* would be granted for enabling him to make himself an instrument."

The forty-feet reflector, the *chef d'œuvre* of Herschel's optical and mechanical efforts, was commenced about the latter end of 1785, and, as Prof. Holden remarks, the history of the instrument extends from this date until the year 1811. The work was carried on assiduously with no further interruption than was occasioned by the removal from Clay Hall to Slough, where, soon after arrival, Herschel began to lay the foundation of the whole structure, and the highly-polished speculum was put into the tube, and the first view through it was obtained on February 19, 1787. But he dates the completion of the instrument from a much later period, for the first speculum came out thinner than was intended, and from its weakness did not permit of a good figure being given to it; a second mirror, cast in January, 1788, cracked in cooling; but in the next month it was recast and proved of the proper degree of strength. In October following a pretty good figure and polish had been assured, and Herschel says he observed the planet Saturn with it; he continued to work upon it till August 27, 1789, when upon trial on the fixed stars it gave a pretty sharp image, and on the following night he records,[2] "Having brought the telescope to the parallel of Saturn, I discovered a *sixth* satellite of that planet, and also saw the spots upon Saturn, better than I had ever seen them before, so that I may date the finishing of the forty-feet telescope from that time." The diameter of the polished surface of the great mirror was 48 inches. In proof of the efficiency of the mechanism for giving horizontal and vertical motions to so large an instrument he mentions that in the year 1789 he had many times taken up Saturn two or three hours before meridian passage and kept the planet in view with the greatest facility till two or three hours after the passage. On the 17th of September a *seventh* satellite of Saturn, the minute object now called *Mimas*, was discovered with the forty-feet telescope, and though the instrument was used for various purposes till 1811, these discoveries of satellites constitute its most prominent additions to our knowledge. Sir John Herschel has stated that the entire cost of construction, including the apparatus for casting, grinding, and figuring the mirrors, of which two were constructed, amounted to 4000*l.*, which sum was provided by King George III. His father observed the great nebula of Orion with the forty-feet telescope on January 19, 1811, and this was one of his latest observations. In 1839 the wood-work had so far decayed as to be dangerous, and Sir John Herschel pulled it down, but piers were erected upon which the tube was placed. Writing in March, 1847, he remarks that it was so well preserved that "although not more than one-twentieth of an inch thick, when in the horizontal position it sustained within it all my family, and continues to sustain inclosed within it to this day, not only the heavier of the two reflectors, but also all the more important portions of the machinery."

As Prof. Holden remarks, and a similar opinion has been expressed previously, it is probable that the general public expected more from the forty-feet telescope than it actually performed; but Herschel gave valid reasons why he did not make more extended use of the instrument: the time required to get it into proper working order and

the number of assistants necessary were impediments in the way of its being utilised for regular observation, and he assures us he "made it a rule never to employ a larger telescope when a smaller will answer the purpose." It is certain that the mirror which was in the tube in October, 1789, the month following that in which Herschel dates the completion of the telescope, was of excellent definition. On the 16th of that month he followed the sixth and seventh satellites (*Enceladus* and *Mimas*) up to the limb of the planet, and witnessed their occultation. Holden writes: "I have never seen so good definition, telescopic and atmospheric, as he must have had on these occasions."

Between the years 1796 and 1799 Herschel made an elaborate classification of stars visible to the naked eye according to their comparative brightness, which he communicated to the Royal Society in four papers published in the *Phil. Trans.* It formed the first general catalogue of the kind, exhibiting the exact state of the sky in his time. A reduction of Herschel's observations was undertaken by Mr. C. S. Peirce, and the results appear in vol. ix. of the *Annals* of the Observatory of Harvard College. So far as we know, their reduction had not been previously attempted. Instances of variability in the light of naked-eye stars were detected during the progress of the classification, the most notable discovery in this direction being perhaps that of the periodical fluctuations of α Herculis, in about sixty days. Another star in the same constellation he considered had totally disappeared in 1791, though he had seen it distinctly in 1781 and 1782.

Herschel was led to his numerous discoveries of double stars by his expectation of being able to determine the parallaxes of stars from measures made at opposite seasons of the year of the distances of pairs which appeared near together, and in the search for such pairs, his first catalogue of upwards of 200 double stars was formed and presented to the Royal Society in 1782. Long had previously measured stars upon a similar plan without success, but Herschel pointed out that his stars were not well chosen.

For the successful application of the method it is necessary that one of the pair of stars should really be situated at a much greater distance from us than the other, and as the most reasonable test of distance, Herschel assumed their difference of brightness, so that he sought for pairs where the components differed widely in this respect. The view therefore which he adopted at this time with respect to two stars seen in close proximity to each other was that one was in nearly the same line of sight as the other, but might be far more distant, thus constituting together what we now term an *optical* double star. From this beginning he was led to the discovery of revolving double stars, stars changing their relative position from year to year; and in 1803 he communicated to the Royal Society his memorable paper: "An account of the changes which have happened during the last twenty-five years in the relative situation of double stars, with an investigation of the cause to which they are owing." He was then satisfied that there were in the heavens pairs of stars which were physically connected with each other. The research for stellar parallax was not successful, but in place of it he discovered the existence of binary systems. He could not in his day decide whether the motions of suns round suns was obedient to the laws of gravitation, but five years after his death the French astronomer Savary proved that one of the revolving double stars, discovered by Herschel, Ursa Major, really was subservient to that law, and every student of astronomy will be aware, the number of physically connected systems where the elements of orbits have been determined, is now a large one, and gradually increasing.

Following at present the order in which Prof. Holden refers to the scientific labours of Herschel, we now look at his researches on planets and satellites, respecting which the improvements he made in the construction of telescopes enabled him to advance knowledge so greatly. He was not particularly occupied with the inferior planets, but he determined the time of axial rotation of Mars with greater precision than before, and also the position of its axis. The times of the rotation of the satellites of Jupiter were found from observations on their changes of brightness, and Herschel also remarked the apparently perfectly explained phenomena attending the transits of the satellites across the disk of the planet. Saturn, Prof. Holden remarks, was the object of his constant attention, and in addition to the discovery of the interior satellites, *Enceladus* and *Mimas*, he left upon record an extensive series of observations of the seven attendants of Saturn at that time known, and determined the time of rotation of the outer satellite *Japetus* upon its axis by similar observations to those made upon the satellites of Jupiter. He ascertained the time of axial rotation of Saturn, and was the first who had succeeded in effecting this in a reliable manner. He also remarked the so-called square-shouldered appearance which the globe of the planet has been suspected to present, and of which we still occasionally hear, though it was long ago proved by Bessel to be an illusion. It is remarkable that notwithstanding Herschel's frequent scrutiny of the planet with all his experience of observation and the advantage of optical means surpassing by far those of his contemporaries, he does not appear to have at any time suspected the existence of the interior obscure ring. He proved beyond doubt that *Uranus* was attended by two satellites, and believed he had observed four others, and for a time on his authority the planet was credited with six attendants.

In 1795 Herschel communicated to the Royal Society a memoir upon the nature and construction of the sun and fixed stars. As to the former he adopted a modified view of the theory which had been advanced by his colleague Wilson of Glasgow; he regarded the sun as consisting of three essentially different parts: a solid and non-luminous nucleus, cool and perhaps capable of habitation, surrounded the atmosphere proper, and still higher the luminous bodies which cause the sun's intense brilliancy. In this paper occurs a remark which, as Prof. Holden observes, has often been brought to bear, in considerations of the causes which maintain the solar light and heat. "Perhaps," he says, "the many telescopic comets may restore to the sun what is lost by the emission of light." We know that however credible in his day points of this theory have given way under our greatly advanced knowledge.

nd orange, and less yellow
Aldebaran contains much
orange and very little yellow. *a Lyræ* contains much yellow, green, blue, and purple." Holden suggests that if we were to attempt to classify these stars by Herschel's observations alone we should put *Sirius* and *Procyon* into one type of stars, which have all the colours in their spectra; *Arcturus* and *Aldebaran* would represent another group, with a deficiency of yellow and an excess of orange and red in the spectrum; *a Orionis* would form a type of those stars, with an excess of red and a deficiency of orange; and *a Lyræ* would represent a sub-group of the first class. The correspondence with Secchi's types and representatives is almost complete.

There remains one other great section of Herschel's researches and discoveries, that relating to the nebulæ and clusters of stars. When he commenced his observations in 1774 very few of these objects were known. Meissier's catalogue of sixty-eight such objects did not appear till 1784, and they were chiefly objects found in his long-continued search for comets. Lacaille contributed twenty-eight from his observations at the Cape of Good Hope. Herschel discovered more than 2500, which he distributed in classes as follows:—Class I. "Bright nebulæ" (1188 in all); II. "Faint nebulæ" (909); III. "Very faint nebulæ" (984); IV. "Planetary nebulæ" (79); V. "Very large nebulæ" (52); VI. "Very compressed and rich clusters of stars" (42); VII. "Pretty much compressed clusters" (67); VIII. "Coarsely scattered clusters" (88). In addition he pointed out large spaces of the sky covered with very diffused and faint nebulosity, which do not appear to have been re-observed. Holden advises that they should be sought for with a powerful refractor, which would be less open to illusions than Herschel's reflectors, and that the instrument should be used in the way he adopted—in sweeping.

Throughout Prof. Holden's interesting memoir there is evinced the same enthusiastic admiration of Herschel and his scientific labours, and he concludes in the same strain: "He was born with the faculties which fitted him for the gigantic labours which he undertook, and he had the firm basis of energy and principle which kept him steadily to his work. As a practical astronomer he remains without an equal. In profound philosophy he has few superiors."

Lists of Herschel's scientific memoirs and of works bearing upon them, are appended to the volume which has formed the subject of our notice, and which, if it has a fault, is of only too limited extent to do full justice to a long life of discovery and research. We will reiterate the hope expressed by Prof. Holden in his preface, as we understand it, that some member of Sir William Herschel's family may at no distant period "let the world know more of the greatest of practical astronomers" . . . "of a great and ardent mind whose achievements are and will remain the glory of England;" and in this connection, that whatever may be found amongst his manuscripts (and as regards the drawings of the nebulæ, no less an authority than the late Prof. D'Arrest has expressed a strong hope of further publication) may at the same time be given to the astronomical public.

BRITISH FISHES

Natural History of British Fishes: their Structure, Economic Uses, and Capture by Net and Rod. Cultivation of Fish Ponds, Fish suited for Acclimatisation, Artificial Breeding of Salmon. By Frank Buckland, Inspector of Fisheries. (London: Society for Promoting Christian Knowledge.)

IT would have been difficult for Mr. Buckland to produce a dull book on any question connected with the economy of our fisheries; his merit in this respect has tended, however, to lead him too much in an opposite direction. It is painful, now that we are deprived of the living presence of the genial naturalist and industrious fishery inspector, to write an unkind word regarding any branch of his life's work; but of this book we are compelled to say that we would have appreciated it better had it been less "familiar" and more scientific. That it should be full of interesting information about fishery matters was quite to be expected from the richness of the stores which its author always had at his command, and if Mr. Buckland had taken pains to digest the *matter* so lavishly extracted from *Land and Water*, and had likewise collated the miscellaneous information contained in the volume with care, he might then have enjoyed the satisfaction of presenting to the public a natural history of British fishes which probably would have compared satisfactorily with other good books of the kind. It is not too much to affirm that a carefully edited selection from the numerous essays contributed to the various blue-books to which the deceased gentleman was so voluminous a contributor, would have made a more interesting volume than the present work. The fact is, Mr. Buckland was nothing if he was not sketchy and rapid; he would not be tied down to severe statements, but preferred to give an off-hand opinion in a dashing way, no matter that he might find out within the year that what he had advanced was very far wrong. In the present volume, as a glance at the plethoric title-page will show, Mr. Buckland attempted too much, with the result that portions of the information conveyed are scrappy, while some of it is probably slightly imaginative: books and articles written in railway trains often enough provide hard work for the reader. In a preface to his work Mr. Buckland takes pains to point out how greatly we are deficient in *exact* knowledge of the habits of our sea-fish, of the times and places of their spawning, of the food they eat, and of the period at which they are able to repeat the story of their birth. Some of the many questions which are asked by Mr. Buckland we are under the impression he should himself have been well able to answer. Whether cods' eggs "sink or swim" has been often discussed, and the author ought to have been able to tell us the truth in that matter; but, on turning to the account given of the cod-fish in the present book (p. 50), it seems to be singularly deficient in its details of the natural history of that animal. So far as we can observe, no reference whatever is made to the theory of Sars with reference to the floating of the eggs, but a few pages relative to the personal adventures of the author are not wanting, whilst the old story of "the Logan fish-pond" is re-told with great circumstantiality. Twenty-five pages of the work are devoted to the salmon (*Salmo salar*), and the essay, confused as it perusal, although it contains, a the book, a good deal about Mr. tulates, as usual from *Land and* some of the big fish in "my mus tedious process to anatomise the co History of British Fishes"; taking its true value, we set down the v collection of miscellanea. The Loch Leven trout (*Salmo Leve* meagre, as is likewise the de other fresh-water fishes, notably Maben. The most suggestive par is that which is devoted to "P to 375). Under the title of "Th Ponds," much interesting matter is of information that must be new to forth. Mr. Hugh McColl contributes a fourth paper on the calculus of equivalent statements (cf. Prof. Jevons's remarks, NATURE, vol. xxiii. p. 485). Other minor articles conclude the volume.

LETTERS TO THE EDITOR

[The Editor does not hold himself responsible for opinions expressed by his correspondents. Neither can he undertake to return, or to correspond with the writers of, rejected manuscripts. No notice is taken of anonymous communications.

[The Editor urgently requests correspondents to keep their letters as short as possible. The pressure on his space is so great that it is impossible otherwise to ensure the appearance even of communications containing interesting and novel facts.]

The New Museum of Natural History

THE new Natural History Museum, opened on Easter Monday, was visited by some 16,000 people of a most orderly and respectable class. Owing to the great exertions of Dr. Woodward, whose zeal is beyond praise, the main gallery, the Pavilion, and the Gallery of Reptiles were shown in a practically completed state. The Mineral Gallery has long been ready, but the arrangement of the botanical section is still incomplete, and it was entirely closed. Some little trouble was caused with the umbrellas, and it might be worth a hint to consider whether a cloak portal is not wanted, the umbrella need be taken away. The idea that people poke with sticks at objects in museums has been long exploded, and no inconvenience is felt at the Kensington Museum, the Louvre, and nearly all foreign galleries and exhibitions, where umbrellas are admitted.

The architecture in the Mammalia Gallery is very effective, and its over-massive character and the variety of tone of the terra-cotta, and the similarity of this material to the shells and skeletons of the fossil mammalia, are most felicitous.

It seems a pity that some style with more repose than "Venetian Renaissance" was not selected. Although very beautiful as a building, and with many features deserving high praise from an architectural point of view, it is evidently not the style most adapted to show off natural history specimens. The polished tiles, Indian Museum, with its rather stark side-chapels, and the Museum of British Zoology are of proportions that will render it difficult to make an effective display in them.

I hope that it is not finally decided to place the recent mammalia on the first floor and the fossils on the ground floor, because the architect's string course would be interfered with otherwise by the cases. The living and extinct mammalia should face each other, and the birds go aloft. Convenience has already been too much sacrificed to architecture. Every time the first floor is visited the length of the Index Museum, 150 feet, must be traversed to reach the stairs, and the same distance must be run by the custodian to reach the door of the Mineral Gallery. That means an immense waste of time. I also notice that the crane is close to the main entrance, and that there are no power lifts.

If it was ever easy to fashion all the ornaments from natural-history objects, it is a pity that the restorations were not accurately made. The oft-repeated figure of a Dipterus wallowing a fish almost its own size, and of spiral shells large to accommodate them to the moulding of an arch, is not instructive. The humour of ornamenting the arch leading into the pavilion with a hideously represented Archæopteryx in high relief, repeated a dozen times, is not obvious, but some joke must doubtless be intended.

The rest of the small bronze and glass conservatories in the botanical department is out of all proportion to the objects they are to contain. Dried stems of tree-ferns and palms, though very interesting in their way, do very well in other museums without glass cases, and can be replenished for next to nothing.

F. G. S.

The Tide-Predicter

MR. EDWARD ROBERTS' letter in NATURE for April 14 contains statements giving an erroneous view of the origin of the tide-predicter. Any one who feels sufficient interest in the subject to derive full information will find it in my paper on "The Tide-Gauge, Tidal Harmonic Analyser, and Tide-Predicter," read before the Institution of Civil Engineers on March 1 and in the abstract of the discussion which followed it, to be published in the *Minutes of the Proceedings* of the Institution (vol. lxv. sess. 1880-81, part iii.), and he will see that my letter in NATURE of March 31 is correct.

WILLIAM THOMSON

The University, Glasgow, April 16

Geological Relations of Gold in Nova Scotia

IN the notice of the report of Mr. Murray on the gold of Newfoundland (NATURE, vol. xxiii. p. 472) I observe a reference to my own opinion of the age of the gold of Nova Scotia which needs some correction. In the second edition of "Acadian Geology" (1868) the gold-bearing series is included in the Lower Silurian, but this referred to the larger sense of that term in which it was used to include the Cambrian as well. In the third edition (1878, Supplement, pp. 81, 85, 92) I have referred this formation, on the evidence of fossils and stratigraphical position, to the age of the Lower Cambrian or Longmynd series, thus placing it on a lower horizon than the fossiliferous Primordial of Eastern Newfoundland, which I suppose to be of the age of the Acadian or Menevian group. There is therefore little difference between Mr. Murray's estimate of the age of the gold-bearing rocks of Newfoundland and my own of that of the similar rocks in Nova Scotia, except that I presume he would classify the Newfoundland series as Upper Huronian rather than Lower Cambrian. With reference to this I have been disposed to regard Mr. Murray's *Aspidella* slates and the associated rocks as equivalents of the Kewenian or "Upper copper-bearing group" of the West, and probably Upper Huronian, in which case they might be a little below my Nova Scotia Lower Cambrian; but the precise age of both series is determined merely by the fact that they appear to belong to the period between the Huronian proper, or Lower Huronian, and the Acadian group, or Menevian (Etage C. of Barrande).

It is proper to add that in the third edition of "Acadian Geology" I have shown that the filling of the Nova Scotia gold veins is much more recent than the containing rocks, and belongs to the time intervening between the Upper Silurian and the Lower Carboniferous, the richer deposits also appearing to be related to the occurrence of intrusive granites of Devonian age. There is no reason, therefore, other than the mineral character of the containing beds, why such veins might not occur in any rocks older than the Devonian, and gold discoveries have been reported in localities where the rocks are supposed to be Huronian and Silurian; but I have had no opportunity of personally verifying these statements. Thus far the important gold veins are known only in that great series of slates and quartzites of the Atlantic coast which I have referred to the Lower Cambrian.

J. W. DAWSON

McGill College, Montreal, April 4

Symbolical Logic

PROF. JEVONS, in his criticism of my method in NATURE, vol. xxiii. p. 485, has stated the main points at issue between us so fully and clearly, and on the whole so fairly, that I need only say a very few words in reply.

As to the charge that my method is ante-Boolian or anti-Boolian, I do not seek to repel it; on the contrary, I maintain that my method is different from Boole's in principle, and very different indeed in its practical working. The really important questions to be settled are these:

1. Are the definitions which I give of my symbols clear and unambiguous?

2. Are the rules and formulæ which I derive from these definitions correct?

3. Are the innovations which I propose of any practical utility?

Now, I do not think that any one who has read my papers in the *Proceedings* of the London Mathematical Society and my articles in *Mind* and in the *Philosophical Magazine* will refuse to answer *Yes* to questions 1 and 2; and with regard to question 3 I can only say that any one who answers *No* is bou... ness to prove the inutility of my innovations by solving ... two of my hardest problems without their aid, and in a ... clear and concise manner. My proposal of an amend... in the *Educational Times* meant nothing more serious ...

Some of my critics (not including Prof. Jevons however ... anxious to magnify the points of resemblance betw... method and its predecessors, especially Boole's, and to ... the points of difference. It may be as well therefore ... briefly what characteristics distinguish my method, ... know, from all the methods which have preceded it, ... advantages, in my opinion, accompany these characteris...

In the first place, then, every single letter in my nota... well as every combination of letters, denotes a *statem...* this simble device I gain the important advantages of ... of expression and uniformity of interpretation and treatm... enables me to express many important logical laws a ... and symmetrical formulæ, as, for instance,

$$(A : a)\,(B : b)\,(C : c) : (A + B + C : a + b + c),$$

which otherwise could not be so expressed. To secure ... advantages I sacrifice absolutely nothing. The rela... classes, including the ordinary syllogisms, I express by ... throughout of *one individual*, just as mathematicians ex... properties of curves, surfaces, and volumes, by speaking ... out of the varying distances *of one representative point*.

My claim to priority on this head has been called in ... on the ground that Boole too, in his equations about "... propositions," denotes statements by single letters. The ... truth however is that Boole takes some pains to prev... readers from imagining that he does anything of the ... says distinctly, and in perfect consistency with the whole ... of his book, in which he describes his algebra of logic ... offshoot and part of the ordinary algebra of quantity, the ... equations any single letter, such as x, denotes the *portion* during which some proposition x is true, the whole time to which the discourse refers being the unit (see "Laws of Thought," from p. 164 to p. 170). Neither will one ... where in Boole's work the idea (suggested to me by ... geometry) of investigating the relations of different classes ... speaking only of *one individual*, and thus dispensing ... with the quantitative words *all*, *some*, and *none*, which ... characteristic of the old logic.

Another peculiarity of my method is that my symbol of ... (an accent) is made repeatedly to apply to expressions of ... complexity, as, for instance, $(x\,y)'$, $(x + y\,z)'$, $(x : y')'$, ... rules and formulæ of operations, to which I find no ... any prior symbolic system with which I am acquainted.

Boole uses $\bar{x}$ as an abbreviation for $1 - x$. Let those ... insist that Boole's horizontal stroke is exactly equivalent ... accent express in his notation the complex equation

$$(x = y)' = (x : y)' + (y : x)',$$

and explain its meaning clearly *without departing from ... quantitative interpretation of his symbols*.

Lastly, my symbol : expresses *implication* or *inference*, ... not, therefore, exactly coincide in meaning with Prof. ... symbol of inclusion —<, as defined by him in his "Logic ... Relatives," published in 1870. This symbol of inclusion ... understand Prof. Peirce's definition of it, is simply equiva... the words "is not greater than," and is therefore restric... number and quantity. It is true that Prof. Peirce in his ... memoir on the "Algebra of Logic" extends the meaning ... this symbol of inclusion, so as to make it also convey the ... meaning as my symbol of implication; but as this meaning ... published subsequently to my second and third papers in ... *Proceedings* of the Mathematical Society, to which Prof. Pe... explicitly refers in his memoir and accompanying circular, ... this later definition does not bear upon the point in discus...

Prof. Jevons objects to my $\alpha : \beta$ as an abbreviation ... $\alpha = \alpha\beta$, because he thinks it obscures the real nature ... reasoning operation. But one might with equal justice ... on the same grounds to α^3 as an abbreviation for $\alpha\alpha\alpha$, or ... left side of the equation in the binomial theorem as an ab... viation for the right side. The symbol $\alpha : \beta$ is the exact ... lent of $\alpha = \alpha\beta$, just as $\alpha = \beta$ is the exact equivalent of ... $(\beta : \alpha)$, and I do not see that I create any obscurity by ... in any investigation, and at any stage of the investigation, ... ever form seems most suitable for the immediate purpose ... view. But whether I am right or wrong in this opinion ...

Heat of Stellar Masses

I SEND you a working hypothesis which I think will well pay for its place in the world. It is as to the heat of large stellar masses; that the imperfect conduction of the kinetic force producing gravitation through large stellar masses causes heat in them.
The quantity of heat stored up may depend partly on the proportion of mass to radiating power, and partly, perhaps, on the condition of the mass for such conduction.

Shadows Cast by Venus

ON March 21 last, about 8 p.m., I was walking among some trees by a river's bank. The ground was covered with recently-fallen snow, and the shadows of the trees were unmistakably, though faintly, traceable on the white surface. The night was dark and the shadows were thrown by Venus, which was shining with unusual brilliancy. I believe this obvious form of the phenomenon is not a common one in our latitude.

The Sparrow and Division of Labour

THE following curious fact may possibly interest your ornithological readers:—Last year and the year previous two pairs of swallows made their nests and successfully reared their broods under the eaves of my house. Within the past fortnight a brace of astute London sparrows have apparently recognised the principle of division of labour as applicable to their requirements in the art of nest-building. They have selected the largest and most substantial of the swallows' nests referred to; and, after devoting a day or two, on starting on their enterprise, to the enlargement of the entrance hole, which was probably too narrow for them, have constructed their bed within of bits of grass and feathers in the usual fashion. They are now enjoying their honeymoon in their new quarters. G. C. WALLICH

SIR PHILIP DE MALPAS GREY EGERTON, M.P., F.R.S.

IN Sir Philip Egerton geologists have lost one of that band of workers who placed their science upon the footing which it now occupies in this country. Unfortunately that band has been of late years greatly diminished by death. Born in 1807, Sir Philip Egerton with his old friend and fellow-worker, Lord Cole (now the Earl of Enniskillen), while still at Oxford commenced the collection of fossils, and very soon their attention was especially directed to fossil fish, of which but very little was at that time known. As specimens of this group of organisms often occur in duplicate, the individuals breaking across so that two opposite slabs each contain one-half, the two friends agreed to share their spoils, and thus both collections were enriched. When in 1840 Agassiz visited this country, intent upon his great ichthyological memoirs, he found in the museums of Sir Philip Egerton and Lord Cole an abundance of materials ready to his hand. The specimens were carefully figured, and descriptions of them included in the several great works which Agassiz successively issued. The original drawings by Dinkel are now among the archives of the Geological Society. But Sir Philip Egerton was by no means merely a collector of fossils, he was a very diligent and successful student of ichthyology. Many valuable papers on fossil fishes were written by him at different times, and a series

of papers published in the decades of the Geological Survey of the United Kingdom are among the most valuable of the works issued by that body. An excellent man of business, Sir Philip took an active part in the administration of the British Museum, the London University, the Geological Society, and other institutions for the promotion of science. All who knew him will miss the kindly face and cheerful manners which distinguished him. Only two days before his death he was in his place in Parliament, but a chill caught during the lately prevalent east winds proved rapidly fatal. At the last meeting of the Geological Society the vice-president, Mr. J. Whitaker Hulke, F.R.S., made announcement of his death, and the sudden and unexpected tidings concerning one who was so widely known and so universally respected cast a sad gloom over the proceedings of the evening.

A correspondent sends us the following additional note on the late Sir Philip Egerton:—

The knowledge of the extinct species of fishes is one of the latest additions to palæontology, and the creator of this department of the science, Louis Agassiz, found the richest materials for his great work in the British Isles. In their acquisition he was greatly aided by Lord Cole, now Earl of Enniskillen, and by Sir Philip de Malpas Grey Egerton, Bart., M.P. Their gatherings resulted in most complete collections of fossil fishes, and science is much indebted to the catalogues drawn up and published by Sir P. Egerton of that preserved at Oulton Park. Besides the species named by Agassiz this collection includes many which have been subsequently determined and described by Sir P. Egerton, whose name will be ever associated with that of Agassiz in palichthyology. In his public career Sir Philip Egerton has been distinguished by his unremitting attention to his parliamentary duties in the long period since his election in 1830. The British Museum sustains a severe loss in a Trustee, elected in 1851, whose scientific knowledge, sound judgment, and administrative ability were of the greatest value, especially to the Natural History Departments. Sir Philip's last attendance at the Board was but a few days—apparently in his usual good health—before his lamented death.

THE SCIENTIFIC PRINCIPLES INVOLVED IN ELECTRIC LIGHTING

FOUR Cantor Lectures on this interesting subject have just been delivered at the Society of Arts by Prof. W. Grylls Adams, F.R.S.; the lectures will be published in full in the *Journal* of the Society of Arts, but we are able to give an abstract of them by Prof. Adams. In the first lecture, the discoveries of Œrsted, Ampère, Arago, and the early discoveries of Faraday on magnetic and current induction were considered in their relation to the principles of conservation and transformation of energy.

Lecture I.—Prof. Adams began by stating and illustrating the fact that important discoveries, after they are made, often pass through a stage of neglect or a stage of quiet development, then enter on the practical stage, when new facts and new inventions follow with great rapidity. The potential energy of the discoverer is transformed into energy of action in many directions with more or less efficiency, according to the retarding state of the medium through which that action takes place.

Electrical science has passed through these stages, whether we regard telegraphy from the work of Sir Francis Ronalds in 1816, who said, "Let us have electrical *conversazione* offices communicating with each other all over the kingdom," down to the establishment of telephonic exchanges, or whether we consider electric lighting from the grand experiment of Sir Humphry Davy in 1813 with a battery of 2000 cells, down to the latest results obtained by means of the most [illegible] magneto- or dynamo-electric machines.

In the year 1819 Œrsted observed the action [illegible] current of electricity on a suspended magnetic [illegible] and in the year 1820 Ampère studied the laws of [illegible] mutual actions, and propounded his celebrated theory [illegible] magnets and of terrestrial magnetism, making magnetism [illegible] the resultant action of electric currents. In the same year Arago discovered the magnetisation produced [illegible] electric currents, laying the foundation of the science [illegible] electro-magnetism.

The discoveries of Œrsted, Ampère, and Arago were [illegible] fully illustrated by experiments, and their connection [illegible] with one another explained. In the same year [illegible] Schweigger invented the galvanometer, and in 1827 [illegible] deduced his simple theory of the action of batteries [illegible] the principle of Volta.

The relation of the experiments of Œrsted, Ampère, [illegible] and Arago to the principle of conservation of energy [illegible] then fully considered. Considering Ampère's experiment of the motion of wires towards one another [illegible] when like parallel currents are flowing in them, it [illegible] shown that the currents must be diminished while they [illegible] are actually approaching, and increased whilst they are [illegible] separating, and so by supposing one of the original currents very small, the relation between Ampère's theory [illegible] and the induction of a current by moving a wire in the neighbourhood of another current was deduced.

The laws of induced currents were then explained and illustrated by some of the early experiments of Faraday, who discovered the induction of electric currents by magnets in 1831.

"In his first series of papers to the Royal Society, entitled—(1) On the Induction of Electric Currents, (2) On the Evolution of Electricity from Magnetism, (3) On a New Electrical Condition of Matter, (4) On Atomic Magnetic Phenomena, Faraday unfolds step by step the laws of the induced current in a helix of wire B placed near to another helix A, carrying a voltaic current.

"That as long as a steady current was maintained in A there was no current induced in B; that on making contact in A or on approaching the wires there was a momentary inverse current in B, and on breaking contact in A or on separating the wires, there was a momentary induced current in B. That as this current was of the nature of an electric wave like the shock of a Leyden jar it might magnetise a steel needle, although it produced a slight effect on a galvanometer, and how this experiment was confirmed, and that the needle was magnetised in opposite ways on making and on breaking contact. Then in his evolution of electricity from magnetism he gives an account of the greatly increased effects on introducing soft iron cores into his helices of wire, and shows that similar effects are obtained by using stationary magnets in place of a helix carrying a battery current round an iron core, *i.e.*, in place of an electro-magnet. He then describes the experiment of introducing a magnet into a coil of wire, and shows that the same current is obtained whether the marked end of the magnet be introduced at one end of the coil or the unmarked end introduced at the other, and that a current is produced in the opposite direction to the former on withdrawing the magnet from either end. Then after describing the method of producing his induction spark and the muscular contractions of a frog by means of a battery and coil, and remarking that the intensity of the spark produced depends upon the rate of separation of the wire from the poles of the loadstone, he concludes thus: An agent which is conducted along metallic wires in the manner described; which, whilst so passing possesses the peculiar magnetic action and force of a current of electricity; which can agitate and convulse the limbs of a frog, and which finally can produce a spark, can only be electricity.

araday, in 1831, of the method
of electricity by the sudden
rom the pole of a magnet, the
laws of these currents were being developed, but for twenty years no attempt was made to apply them for the purposes of electric lighting. Voltaic batteries were being improved, and the more constant batteries of Daniell, of Grove, and of Bunsen were discovered, and these were the sources of electricity employed to produce the more powerful currents of electricity. In this country forty or fifty cells of Grove have given us the electric light for optical experiments in our laboratories, and the light was kept steadily in the same position by the elaborate arrangements of wheel-work and electromagnets devised by Staite in 1847 and by Foucault, which have reached very great perfection in the hands of Duboscq. In the Duboscq lamp the current passes always in the same direction, and the positive carbon becomes hollowed out, and burns away about twice as fast as the negative carbon, which becomes pointed. The carbons are moved towards one another by means of a drum carrying two wheels, whose diameters are as 2 to 1, which move two racks which bring the carbons together. This lamp is especially adapted for projection on a screen, and we may study the forms of the carbons by projecting them, and also study the kind of light given out by the vapours of metals burning in the arc ; if we burn silver in the arc we shall see that it is rich in the violet or chemical rays, which points to the reason why the salts of silver are so much used in photography.

Even with constant batteries there is great variation in the steadiness of the electric light, but much more is this the case when the current of electricity is obtained by the motion of a coil of wire in a magnetic field, for every alteration in the resistance in the circuit reacts on the machine producing the current so as to increase the disturbance. Hence regulators are necessary in order to control the current, so as to keep the light constant. In electric lighting regulators may act on the electric lamps themselves so as to give a steady current between the carbons by keeping them the same distance apart, or regulators may be used in another part of the circuit to control the current automatically by causing it to introduce extra resistance when the current increases, and to diminish the resistance when the current diminishes.

Various methods of regulating the current, including those employed by Siemens, Lane Fox, and Edison, were then described. In order to find the yield or effective work of batteries or magneto-electric machines and their efficiency, measurements of the current and of the work done by the current must be made.

There are four principal methods of measuring electric currents :—

1. The galvanometer method, by which with a galvanometer of small resistance a very small fraction of the current is measured, and any error of observation is multiplied in estimating the total current flowing.

2. The heat method, in which the current is measured by the heat developed by the current in a given resistance in the circuit according to Joule's law, that the heat is proportional to the square of the strength of current.

3. The electrometer or potentiometer method, in which the difference of potential between two points in the circuit with a given resistance between them is directly measured and the current deduced from Ohm's law.

In using Thomson's quadrant electrometer for strong currents, the needle and one pair of quadrants should be connected together, so that the deviation is then proportional to the square of the difference of potential, and this method is applicable for continuous currents and also for alternate currents. By means of two electrometers in different parts of the circuit the current and also the work done by it may be at once measured. If, for instance, one of the electrometers be connected with the two carbons, the difference of potential and work done between the carbons may be determined. By such measurements it has been found that there is an electro-

motive force of 30 or even 40 volts between the carbons in the electric arc, but that the actual resistance of the arc is small.

4. The electro-dynamometer method, the best method fitted for ready measurement, in which the current in one coil is attracted by the same current flowing in another coil, and the attraction is balanced by a spring as in Siemens's electro-dynamometer, or by weights as in Trowbridge's electro-dynamometer. A beautifully-made instrument by Elliott and Co. was exhibited, in which the coils are thick copper bands, fixed coils being placed on each side like the coils of a tangent galvanometer, the suspended coil being placed between them in place of the magnet of the galvanometer. This instrument is especially useful for the measurement of very large currents in absolute measure.

The remainder of the second lecture was devoted to the consideration of the efficiency of batteries or of magneto-electric machines when employed as motors to do work by means of electricity, and it was shown that the greatest amount of effective work is produced when one-half the energy of the battery or current-generating machine is converted into useful work in the electric circuit. Numerous experiments were made with Clarke's and other magneto-electric machines to show that by the same machine work may be produced by sending a battery current through it, causing motion of the armature carrying the current in accordance with Ampère's laws, or a current of electricity may be generated by turning the armature, *i.e.* by doing work upon the machine, so that a magneto-machine is a reversible engine. A small magneto-machine with a Siemens armature was made to work a pump, or when turned by hand produced a current of electricity. Also a battery current in a Gramme ring in front of the poles of a Jamin magnet caused rotation of the ring and turned the heavy driving-wheel of the machine, and on removing the battery and turning the driving-wheel by hand, a current of electricity was produced which caused a piece of platinum wire to glow. Also a Tisley's hand dynamo-machine was employed either to heat a long piece of platinum wire or to drive another magneto-electric machine, so producing a secondary current capable of heating a considerable length of platinum wire.

(*To be continued.*)

THE FRENCH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE AT ALGIERS

Algiers, April 14

THE number of members enrolled for the present Congress is much larger than might have been expected when we consider the length of the journey. To a Parisian member this is such as would be experienced by a Londoner if our British Association met in Gibraltar. Yet more than 1500 names are on the list. Few of these are familiar to us. There appear to be an unusual number of doctors and professors of anatomy and physiology, and of civil engineers. We fear we must also confess that a great many people possessing little or no interest in science, who will not be present at a single sectional meeting, have joined the Association for the sake of seeing Algiers. The general character of the meeting appears to be that of a great excursion. There are only five days partially devoted to work; while the banquets, balls, fêtes, courses, and "fantasias" are rapidly multiplying.

On arriving in Paris we were told that the steamer which was to have conveyed us to Algiers had been requisitioned by the Government for the transport of troops to Tunis; but the Company determined at last to take both soldiers and *savants*, and the result was of course an overcrowded boat and excessive discomfort. With accommodation for fifty first-class passengers no less than one hundred and twenty-nine were crowded in the vessel, and had the voyage been anything but the smoothest, it would have been most wretched. As it was bad enough; the food was insufficient in quantity and detestable in quality, and passengers were glad to find six feet of floor to sleep upon. In Algiers itself hotels are quite full, and the salons will be used as dormitories.

The Congress will be opened to-day by the inaugural address of M. Chauveau, which is to be given in the theatre at three o'clock, after which the members will remain and resolve themselves into a general committee to discuss the creation of a sixteenth section relating to pedagogy; afterwards the secretaries of sections will meet to arrange their proceedings, and at 9 p.m. the members will be received by the Municipality at the Hôtel de Ville. The general programme for the rest of the week is as follows:—

Friday, April 15.—Sectional meetings in the forenoon, general meeting at 2 p.m.; conference at half-past 3.

Saturday.—Sectional meetings in the morning, excursion to the Algerian Exhibition in the afternoon; Arab fête and a *soirée* given by the Municipality.

Sunday.—"Courses et fantasia."

Monday.—Sectional meetings in the morning; grand procession through the town in the afternoon, and a ball or *fête* in the evening.

Tuesday.—Sectional meetings; general concluding meeting; in the evening a ball given by the Governor.

On *Wednesday* the excursions commence; there are both general and sectional, and the longest lasts a fortnight.

A complete list of the papers to be read has not yet appeared, but in the list already published we do not notice anything of special interest.

English science is represented by Dr. G. H. Glaisher and Mr. Siemens, who will both read papers.

The Association has presented to each member a work in two volumes entitled "Notices scientifiques, historiques, et economiques sur l'Alger et Algérie."

April 16.

The theatre was well filled yesterday afternoon to hear the address of the president, M. Chauveau, who is Professor of Physiology in the Lyons Veterinary College. His discourse was of a far too technical character to be of interest to the majority of his audience, and dealt principally with the germ theory and Pasteur's theory of fermentation. It was read throughout without the slightest attempt at oratory, and it contained various political allusions which were much applauded. In the evening the members were entertained by the Municipality, and the town was illuminated. The real work of the Association commenced this morning, when the sections met at hours varying from eight to ten o'clock. We fear that the number of papers is small, and that the Association does not represent French science at all completely. In the Physical Section, for example, the names of only two authors of papers appear to-day—MM. Brillouin and Crova. At 9 a.m., when the section was announced to meet, no one was present. Shortly afterwards the secretary arrived, but an hour later the section had not met. The average number of the audience at the sections which had already met did not at this time exceed ten.

Among the more interesting papers announced for to-day are the following:—M. Marcheray, on Telephonic Communication in large towns; M. Tacchini, on the Observatories of Etna and of Chimona; M. Thoulet, on the Employment of the Microscope in Chemical and Physical Researches connected with Mineralogy; M. Prungrueber, on 300 Anthropological Observations on the Kabyles of the Djurdjura Mountains.

The Medical and Agronomical Sections have also communications. The new section of Pedagogy has been established under the honorary presidency of

odard, Director of the École Monge in Paris, who has ought twenty of the pupils with him. M. Fau, ttorney-General of Algiers, is the President, and two ıpers are announced for to-day:—One by M. Robert, ı the Humanitarian and Pedagogic Ideas of Jean omimiac (1572-1670); the other by M. Berdellé, on the mployment of Colours as a Means of Retaining in the ind certain given Numbers.

An excellent geological map of Algiers to the scale of in 800,000 has recently been completed, and the forma- on of it has led to the simultaneous observation of ırious facts connected with the physical geography of ıe Central Sahara. A map of the proposed interior sea of ıe Sahara has also been prepared, and the Trans-Sahara ailway is spoken of as more than a probability. But e very much doubt if this can ever be a success. If it onnected flourishing towns or portions of territory in hich great cities are ever likely to be established, as in ıe case of the new American railways, there would be ome hope for it. As it is, however over-populated the orld may become, there is no likelihood of the forma- on of settlements in the heart of an unhealthy tropical egion.

G. F. RODWELL

MR. DARWIN ON VIVISECTION

FROM the *Times* we reproduce the following letter addressed by Mr. Darwin to Prof. Holmgren of Upsala, in answer to a request for an expression of his opinion on the question of the right to make experiments on living animals for scientific purposes—a question which is now being much discussed in Sweden:—

"Down, Beckenham, April 14, 1881

"Dear Sir,—In answer to your courteous letter of April 7 I have no objection to express my opinion with respect to the right of experimenting on living animals. I use this latter expression as more correct and comprehensive than that of vivisection. You are at liberty to make any use of this letter which you may think fit, but if published I should wish the whole to appear. I have all my life been a strong advocate for humanity to animals, and have done what I could in my writings to enforce this duty. Several years ago, when the agitation against physiologists commenced in England, it was asserted that inhumanity was here practised and useless suffering caused to animals; and I was led to think that it might be advisable to have an Act of Parliament on the subject. I then took an active part in trying to get a Bill passed, such as would have removed all just cause of complaint, and at the same time have left physiologists free to pursue their researches—a Bill very different from the Act which has since been passed. It is right to add that the investigation of the matter by a Royal Commission proved that the accusations made against our English physiologists were false. From all that I have heard however I fear that in some parts of Europe little regard is paid to the sufferings of animals, and if this be the case I should be glad to hear of legislation against inhumanity in any such country. On the other hand I know that physiology cannot possibly progress except by means of experiments on living animals, and I feel the deepest conviction that he who retards the progress of physiology commits a crime against mankind. Any one who remembers, as I can, the state of this science half a century ago must admit that it has made immense progress, and it is now progressing at an ever-increasing rate.

"What improvements in medical practice may be directly attributed to physiological research is a question which can be properly discussed only by those physiologists and medical practitioners who have studied the history of their subjects; but, as far as I can learn, the benefits are already great. However this may be, no one, unless he is grossly ignorant of what science has done for mankind, can entertain any doubt of the incalculable benefits which will hereafter be derived from physiology, not only by man, but by the lower animals. Look, for instance, at Pasteur's results in modifying the germs of the most malignant diseases, from which, as it so happens, animals will in the first place receive more relief than man. Let it be remembered how many lives and what a fearful amount of suffering have been saved by the knowledge gained of parasitic worms through the experiments of Virchow and others on living animals. In the future every one will be astonished at the ingratitude shown, at least in England, to these benefactors of mankind. As for myself, permit me to assure you that I honour, and shall always honour, every one who advances the noble science of physiology.

"Dear sir, yours faithfully,

"CHARLES DARWIN

"To Prof. Holmgren"

THE MAGNETIC SURVEY OF MISSOURI

IN the summer of 1878 the writer began a magnetic survey of the State of Missouri. The work of the first summer was confined to the north-east part of the State, and no points of interest were brought out. During the summer of 1879 the work was extended over the western half of the State, and it was made apparent that diversity of surface exerted a much more important influence than had been suspected. The lines of equal declination were found to bend very sharply upon entering the large valleys, and the needle showed a *tendency* to set at right angles to the valleys. This tendency seemed to be greatest when the general direction of the valley made an angle of 45° with the *normal* position of the needle, or roughly, when the valley runs north-east and south-west, or north-west and south-east. This tendency seems to be inappreciable when the valleys run north and south, or east and west.

In the report of 1878 (*Trans.* St. Louis Acad. of Sc., vol. iv. No. 1, p. 143) it was suggested that this might result from the bending of the stream-lines of the earth-current sheet, due to the greater conducting power of the moist valleys. In order to settle this point, further examination is necessary, and it is proposed to determine the earth-currents at a number of properly selected stations.

During the summer of 1880 the work extended over the south-eastern part of the State, where still more important flexures of the isogonic lines were discovered. Here, however, the position of the needle is probably affected by the iron deposits, and the effect of contour is studied to less advantage. At the close of 1880 observations had been made at forty-five stations. In order to bring out the effect of contour, a relief map of the State was constructed in wax, and was finally reproduced in plaster. In this work use was made of the profiles of all the railroads in the State, together with a list of over 300 elevations in the State, collected by Gannett. The isogonic lines, which were first drawn upon an ordinary map, in the usual manner, to represent the observations thus far made, were then copied upon the relief map. In doing this it became apparent at once that the forty-five stations were wholly inadequate, and that the isogonic lines thus drawn are probably deserving of about the same weight that a topographical map would deserve if constructed from elevations at these stations.

The Chart is made after an artotype, which will accompany the third annual report in No. 2, vol. iv. *Trans.* St. Louis Academy of Science. In the original map the horizontal scale is twenty miles to the inch, the elevations being exaggerated 200 times. This exaggeration was necessary in order to bring out the form in the photograph, since on a relief map, 150 feet square, the

greatest difference in elevation in the State would be represented by a vertical height of one inch. The horizontal scale of the cut is sixty-two miles to the inch.

The map represents only the grand outlines of surface as obtained from railroad profiles, and barometrical measurements. The dotted lines on the map are lines of equal variation of the magnetic needle: thus, on every part of the line marked 8°, the needle points 8° east of north, &c. These lines are drawn to represent the observations already made, and show in a general way the variation of the needle in the State. The map also shows that there is a marked relation between the direction of these lines and the contour of the surface. It cannot be said that it shows what this relation is, but it is probably due largely to the deflection of the stream lines of the earth current sheet, caused by unequal conducting power. This explanation necessitates the existence of

looped areas in certain regions in the St
of which is already indicated by the det
loop in the 7° 30′ line, with its incle

lines, the observations have been repeated at various localities in the region, until it was clear that no minute local effects existed.

The value in the Iron Mountain region is the mean of many hundreds of determinations made with a solar compass by Pumpelly and Moore in 1872. This region is in the east part of the 7° 30′ loop. In the western iron-field, which is nearly coincident with the 7° oval, our observations were repeated at various points (the aim being to *avoid* iron deposits) without finding any local action.

In conducting the survey, a magnetometer belonging to Washington University was used, but the dip circle and declinometer were kindly furnished by Prof. J. E. Hilgard of the U.S. Coast and Geodetic Survey. Thus far the survey has been conducted wholly on private means, in which we have been aided by the railroad companies, and by citizens of St. Louis for the completion of the survey is now lature of the State.

PRIMITIVE MARRIAGE. C

THE chief object of Mr. Fison's memoir on Kamilaroi marriage, de ship, is "to trace the formation of the marrying divisions which have been fou savage and barbaric tribes of the pr show that what Mr. Morgan calls the pu the "Turanian" system of kinship, lo

"Kamilaroi and Kurnai: Group Marriage, Marriage by Elopement; also the Kurnai Tribe, th War." By Lorimer Fison, M.A., and A. W. H Introduction by Lewis H. Morgan, LL.D. (George 1880.)

em. His coadjutor, Mr. Howitt, though he has had me interesting information to give about the Kurnai ibes of Gippsland, has had the same chief object; so at the work the two have produced is much more a olemic on behalf of Mr. Morgan than a record of new ustralian facts. We must begin, then, by stating what Ir. Morgan's theories are (so far as the work before us concerned with them), and indicating, and estimating ie value of, the evidence on which they rest.

Mr. Morgan, having collected a great mass of facts oncerning the terms in use between relations and connections throughout the world, and having found that ose terms were, broadly speaking, divided into three rders, proceeded to spell out of the two earlier orders he third consists of the modern terms of consanguinity nd affinity) the whole of the early history of marriage nd of the family. In what he has called the Malayan ystem of relationships, parent and child, grand-parent nd grandchild, and brother and sister (or rather elder rother, younger brother, elder sister, younger sister, for here are no words for brother and sister) are the only erms in use; and one or other of these terms is used in ddressing a person, according as the person addressed s of the speaker's generation or of the generation above, r of that below it. They are the terms always used hen persons address one another, there being among hose who use the system an invincible objection to the nention of their personal names. Mr. Morgan assumed hat those terms were expressive of consanguinity and ffinity; and conjectured that when first used they accuately described the relationships at the time existing, as near as the parentage of children could be known." And it appeared to him that if there were a body of men nd a body of women in the same tribe who all regarded ach other as brothers and sisters, and all the men narried all the women in a group, there would exist a narriage and family system which would explain the Malayan terms—the relationships arising out of which, o far as they were ascertainable, "as near as the arentage of children could be known," those terms would accurately express.

Accordingly, he framed the hypothesis that the first tage of marriage was the marriage in a group of men nd women of the same blood calling themselves brothers and sisters. The family founded upon this kind of marriage he has named the consanguine family, and he regards it as the earliest form of the family. He does not say that such a system of marriage, or such a family system as he has supposed, has been found at any time anywhere; what he says is that this supposition of his explains the origin of the Malayan terms, and that nothing else can explain them. But does it explain them? It is at once obvious that there is one term, and that the most important of all, the use of which Mr. Morgan's hypothesis does not account for. Paternity may be doubtful—and if it were thought of at all in a group such as Mr. Morgan has conceived of, any man of the group might have as good a right as any other to be called father of any child born within it. But there can be no doubt about a man's relationship to his mother. In the case of mother and child the parentage is known with certainty, and therefore, on Mr. Morgan's hypothesis, a man should in the Malayan system have had only one mother. Now that system applies the term for mother to many women besides the actual mother—mother's sisters, father's sisters, uncle's wives, and so on, if not indeed to all women of the mother's generation. Here then the hypothesis breaks down; and the point at which we find it breaking down is really the only point at which it can be tested. The relationship between mother and child, too, which is confused or ignored in the Malayan system, is the one relationship of which it can be said with confidence that no system really founded on relationship could fail to recognise it. The explanation Mr. Morgan offers is that in the Malayan system the relationship of stepmother "is not discriminated," and there being no name for stepmother, stepmothers had to be called mothers, because "otherwise they would fall without the system." And he has what may be called a subsidiary hypothesis to account for there having been no discrimination between stepmother and mother. It is that the affiliation of children to the groups of men and of women to which they belonged would be so strong "that the distinction between relationships by blood and by affinity would not be recognised in every case." The fact of motherhood would be made little of, that is —there would be no discrimination between stepmother and mother—because the whole group would be, by a child, regarded as its mother. But this is equivalent to saying that, from the nature of the case, it was not to be expected that note should be taken of the relationships that could be known; and that is to abandon the hypothesis—as well as to deny us all chance of judging whether it is a good or a bad one. Possibly explanations of the failure of his hypothesis, such as Mr. Morgan suggests, might have some weight were he accounting for the Malayan terms as terms of address; but he takes them to denote actual relationships "as near as the parentage of children could be known." And no explanations can get over the fact that the Malayan terms are equally extensive in their application where, in the consanguine family, parentage would be known with certainty, and where it would not be known at all. The consanguine family is clearly a bad hypothesis. It might be thought it would hardly seem to anybody a plausible one; but Mr. Morgan always speaks of it as if it were among the best vouched of historical facts; and we are bound to say that Mr. Howitt believes in it as implicitly as Mr. Morgan.

To show the hypothesis of the consanguine family to be unstateable is to undermine Mr. Morgan's whole history of marriage and of the family. But Mr. Morgan has propounded a hypothesis as to the second form of marriage and the second form of the family, and as it is at this point that Mr. Fison (who does not quite believe in the consanguine family) lends him his advocacy, it is indispensable that we should give some account of it. Punaluan marriage, upon which was founded the punaluan family, was introduced by some reformatory movement, according to Mr. Morgan, to put a stop to the evils attendant upon brother and sister marriages. It existed in two forms. In one form of it a group of men, brothers or reputed brothers, had in common their wives who were not their sisters and not the sisters of each other; in the other form, a group of women, sisters or reputed sisters, lived in common with husbands who were not their brothers and not the brothers of each other. Punaluan marriage has not been observed at any time anywhere any more than the consanguine family; but Mr. Morgan believes that, in both its forms, it has existed everywhere, and probably during many ages. A correspondent wrote to Mr. Morgan stating that in the Sandwich Islands men whose wives were sisters and women whose husbands were brothers called each other punalua, which meant dear friend or intimate companion. And possibly drawing his bow at a venture, "the relationship," he said, "is rather amphibious. It arose from the fact that two or more brothers with their wives, or two or more sisters with their husbands, were inclined to possess each other in common." Whether conjecture or fact, this amounts to very little; but it was this which gave Mr. Morgan the suggestion of punaluan marriage. For proof of his hypothesis he again relied upon the terms he had collected—and at first upon its fitness to explain those same Malayan terms which, as we have seen, have more than enough to do to bear the weight of the consanguine family. In his latest work ("Ancient Society") he holds it to be proved by a nomenclature considerably

different from the Malayan—his second order of terms which he has named the Turanian system of relationships. He regards the terms in this system also as accurately describing, "as near as the parentage of children could be known," the relationships existing at the time when they came into use. It differs from the Malayan in including words for cousin, uncle and aunt, and nephew and niece—or words which Mr. Morgan has so translated. It will be found, however, that Mr. Morgan does not use the punaluan family in accounting for any one of the Turanian terms. Those of them which coincide, or partly coincide, with the Malayan terms he had already accounted for by the hypothesis of the consanguine family, and he does this over again; the others he accounts for, or tries to account for ("Ancient Society," pp. 442–445), by means of exogamy alone. His reasoning is exactly what it would have been had the punaluan family never occurred to him. Indeed it has been an embarrassment to him; he has had to keep it out of his reasonings. For the punaluan family is, *ex hypothesi*, in two forms, and neither form could, "as near as the parentage of children could be known," yield both the Turanian sense of father and the Turanian sense of mother. Where the husbands were punalua, Mr. Morgan's reasoning would make them all, though not brothers, fathers of children born within the group, and it would exclude their brothers from being considered fathers. But, in the Turanian system, a father's brothers are called fathers. Similarly where the wives were punalua, Mr. Morgan's reasoning would make them, though not sisters, all mothers of the children of each of them, and would exclude their sisters from being considered as mothers. But, in the Turanian system, a mother's sisters are called mothers. Mr. Morgan has not failed to see this, and he has actually again framed a subsidiary hypothesis to give his hypothesis of the punaluan family a chance of living. This is (see "Ancient Society," p. 445) that where a group of sisters married men who were not brothers, they also became the wives of all the brothers "own and collateral"—that is, all the brothers and one-half of the cousins, however far removed—of each of their husbands; and, similarly, that when a group of brothers married women who were not their sisters, they also became the husbands of all the sisters and one-half of the cousins of each of their wives. All that need be said of this subsidiary hypothesis is that it gives quite a new look to the punaluan family—and that the effect of it, like that of the secondary hypothesis formerly noticed, is to deny us all chance of judging whether the principal hypothesis is a good or a bad one. The justification offered for it is that "the system (the Turanian) treats all brothers as the husbands of each other's wives, and all sisters as the wives of each other's husbands, and as intermarried in a group"—but that is equivalent to saying that the system has taken no impression of the punaluan family, and gives no countenance to Mr. Morgan's hypothesis. As, apart from "the system," he finds nothing to say for it, it is difficult to see how any one can resist the conclusion that that hypothesis must be dismissed, and that it must be ranked among the wildest chimeras that have ever possessed the brain of a man of science.

Now, do Mr. Fison and Mr. Howitt give in any degree to Mr. Morgan's hypotheses the support of which they are in need? The answer must be no—and must be no even if we receive as facts the assumptions as to fact from which they set out. Mr. Howitt accepts both the consanguine family and the punaluan family, while Mr. Fison offers himself as the advocate of the latter only. But Mr. Howitt has nothing new to say for the consanguine family; he believes in it, and argues from it as if it were known historical fact—that is all; and so of it no more need be said. What then do his colleague and he find to say for the punaluan family? Literally, not a word. Mr. Howitt simply takes it for granted as he does the consanguine family. Mr. Fison, in beginning, takes to show that it results logically fro a his type —for it is no more than that—of "exogamous marrying divisions," but he does not attempt to And, in fact, his "intermarrying divisions" are different from the punaluan family, and leave no it, and no room for it; that is, his hypothesis is from and exclusive of Mr. Morgan's. In Mr. hypothesis, a group of men who are considered and a group of women who are considered sisters the men and women of the same generation divisions which intermarry with each other, with each other—are by birth husbands and each other; whereas, in the punaluan family, husbands are brothers the wives are not sisters punalua; and when the wives are sisters the are not brothers—they are punalua. Men brothers are restricted to women who are each sisters, on Mr. Fison's hypothesis; but, on Mr. men who are brothers marry women who, as not each other's sisters. The marriage law Mr. Fison's hypothesis would have to be given the punaluan family could have a chance of justly observes, his intermarrying divisions "wo precisely the reformatory effect" which Mr. attributes to the punaluan family—so that, divisions, the punaluan family would not be reformatory purposes; and as Mr. Fison's vie the totem clan grew up within his divisions, marriage law still subsisted, the punaluan fam not be needed to give birth to the clan (which M says it has done). And, clearly, there would b room than need for it. It thus appears that, supporting the hypothesis of the punaluan fa Fison has put it aside, and offers an improved (suggested, no doubt, by Mr. Morgan's) in p We have seen that he does not accept the o family either. He does not, indeed, repudiat to connect it with his intermarrying division him so difficult that he thinks the one could changed into the other only through the inte "a higher power." He is not afraid of the which he might be exposed were he to acco first formation of the divisions by such a hypo he thinks it unnecessary to go behind them. now shown in what manner Mr. Fison su Morgan—and we have shown that Mr. Morga position to give any support or countenance t

To show that the Turanian terms would res from his own hypothesis is what Mr. Fison ha There are in a tribe two divisions which do marriage within the division, and are restrict marrying with one another. All the men in are the husbands of all the women of the sam in the other; the wife does not come into th division; and descent is reckoned through The group of men marries the group of wome the group that is husband, the group that group that is father, mother, son, or nep person in it taking, however, all the relati arise to it. Such is the hypothesis. illiam Ridley, a Presbyterian
blished a statement as to the
nilaroi, which statement is now
own authority, to have been
r. Fison still treats it as entirely
id more correct information as
rder. Mr. Ridley said that the
into four castes of men and
four of women, and that (with one exception) the men of a caste could marry only women of one other caste. Murri, feminine mata; kubbi, feminine kubbitha; kumbo, feminine butha; and ipai, feminine ipata, were the castes; and he said that a murri could marry a butha and no other woman, and that his children were not murri and butha, but ipai and ipata; and that, similarly, a kubbi could marry only an ipata, his children being kumbo and butha; and a kumbo only a mata, his children being kubbi and kubbitha; while an ipai, besides being free to marry any kubbitha, could marry any ipata not of his own family—his children, when he married a kubbitha, being murri and mata, and when he married an ipata, kumbo and butha. Mr. Ridley repeated this statement without change in 1855, and he told it in 1871 to Mr. Fison with this amount of change, that instead of castes he now spoke of classes (in unhappy imitation of Mr. Morgan), and of four classes, with men and women in each, instead of four classes of men and four of women; and that he described the marriage of ipai with ipata (that is with a woman of his own class) as an infringement of rule—changes that may fairly be ascribed to the initiative of Mr. Fison. Mr. Fison, putting aside the marriage of ipai with a woman of his own class as an irregularity, and idealising Mr. Ridley's statement, at once formed the hypothesis that all the men of one class originally were by birth the husbands of all the women of the same generation in the class with which they might intermarry. This, although he knew from Mr. Ridley that polygamy was largely practised among the Kamilaroi. Much licence was allowed; and the only word for spouse signified a person whom one is free to marry; and these two facts seemed to him to override Kamilaroi practice, and to prove that marriage had been communal, to begin. In the same year (1871), however, Mr. Ridley was again among the Kamilaroi, and sent to Mr. Fison a statement which should have shaken his faith in his hypothesis—both because of the new matter it contained, and because there were in it what he himself perceived to be errors of observation. Mr. Ridley has published several statements since, all containing obvious errors of observation or slips of memory, and it is impossible to receive even his latest statement as final. But observe what his latest statement is, and compare it with Mr. Fison's hypothesis. It is that the Kamilaroi are divided into totem clans (iguanas, paddy-melons, opossums, emus, blacksnakes, bandicoots); that every native has three names—a personal name (carefully concealed), a "class" name, and a totem name; that children take both the class name and the totem name through the mother; that the men and women of every class are free to marry one another, provided they are not of the same totem—and that, besides, murri may marry any butha, kubbi any ipata, kumbo any mata, and ipai any kubbitha. If his statements can be trusted, murri and butha, kubbi and ipata, kumbo and mata, and ipai and kubbitha, who are free to marry one another, are never of the same totem—so that all the marriages which certainly are permitted are marriages between persons of different totems. Mr. Ridley still leaves each class restricted from intermarrying with two others. So much of his original statement he has not yet found to be wrong. But the class name does not prevent marriage within the class. The notion that the Kamilaroi were in intermarrying or husband and wife "castes" was certainly erroneous. Is it likely then that the class-name is any bar to marriage outside the class? Is it not far more likely that there is still something for Mr. Ridley or some other inquirer to find out, and that, in the main, identity of totem is the only bar to marriage? We say in the main, because it is very likely that there are also regulations to prevent marriage between persons near in blood who are of different totems. Mr. Lance, who is a great authority with Mr. Fison, and who was Mr. Ridley's first informant, had got into his

head that the Kamilaroi were divided by their names into castes with the marriage law which Mr. Ridley first described, and, meeting with an ipai whose wife was an ipata, he regarded him as a daring transgressor of the customary rule. The man told him that he and his wife were free to marry because they were not of the same mudji (totem); and, thereupon, Mr. Lance (who evidently had never before heard of totems) told Mr. Ridley that the ipai were privileged above their neighbours in being free to marry women of their own class who were not of the same family with them; and Mr. Ridley told the world that they were the aristocratic caste among the Kamilaroi. (He has since stated that the murri are the aristocratic class.) This is the sort of observation we are questioning. Had Mr. Lance seen in operation a rule intended to prevent, say a man from marrying his own daughter, he might easily have magnified it into a rule prohibiting two whole "castes" from marrying. And in all probability it was something like this he did. It is the ludicrously wrong impression he had before he met the ipai aforesaid that Mr. Fison has taken for the basis of his hypothesis—but from even that to the hypothesis is a tremendous jump. And, after all, even if we overlook the inadmissible assumption which forms an essential part of the hypothesis, it appears not to be good for anything.

What have been called caste or class names appear, so far as the evidence goes at present, to be names merely, and to have no effect on the right of intermarriage. The system of naming is certainly very peculiar. The names alternate in successive generations. That is not in itself peculiar; but the same name is taken by all the sons, the same name by all the daughters. Thus ipata's children are the sons all kumbo, and the daughters all butha; and, again, butha's children are ipai and ipata. It is a pretty widely spread system. Mr. Howitt says that, as far as he knows, it prevails among all Australian tribes; but this is going a vast deal too far; and is calculated to undermine faith in Mr. Howitt's judgment, for it plainly does not prevail among the Kurnai whom he himself has described. His report shows nothing like castes or classes among them; the men, he says, are all called yeerung (emu-wren) by the women, and the women all djeetgun (superb-warbler) by the men; but this (whatever it may mean, and it may mean very little) does not divide the Kurnai into anything other than men and women. Mr. Fison has had from a number of correspondents statements which he takes to mean that among tribes other than the Kamilaroi which have this system of naming, there is no marriage between persons of the same name; but his correspondents are neither, as regards opportunity or observing power, above Mr. Lance; and Mr. Ridley's study of the Kamilaroi, imperfect as it has been, gives the only evidence that can be regarded as trustworthy. Mr. Fison has amended the list of marriages allowed among the Kamilaroi, given by Mr. Ridley, as he says, on later information; but anonymous information cannot be thought of much value on this matter as against the authority of Mr. Ridley. Mr. Fison is too easily satisfied with anything that seems to make for his view to be indly trusted in such a matter. We find him inferring from there being no marriage between blood-relations—which may mean totem clans—among people who have the class names that there is no marriage within the class. We find totem clans, too, reported to him as classes and ranked by him as classes; and "divisions," which probably mean totem clans, are also ranked by him as classes. On the other hand he candidly gives at least one case in which the class-names are said not to restrict marriage. He gives at the very beginning of his book a native legend of brothers and sisters having married at the first—a legend which both Mr. Morgan and he make much of. We are surprised, however, at his missing the true point of it. What it exhibits is not a movement to "intermarrying divisions" or classes, but to the establishment of totem [illegible] *These* are all the natives seem to have thought [illegible] explanation.

We should have been glad to notice Mr. H[illegible] account of the Kurnai at some length, but we [illegible] brief. The Kurnai have kinship through males [illegible] gamy—that is, prohibition of marriage within the [illegible] and as was to be expected in such a case, the [illegible] form local tribes. He does not expressly tell us [illegible] or not these clans or local tribes are distinguish[illegible] totems (which shows that he meant to be careful, [illegible] his information was very far from being comple[illegible] incidentally he lets out that they are. When a [illegible] young woman meets a young fellow who, being a [illegible] looks as if he might make a husband for her, [illegible] eat kangaroo, opossum, blacksnake? is her first [illegible] after saluting him. Presumably the animal she [illegible] her own totem. If the stranger may eat it he [illegible] her. As for his discovery of marriage by elopem[illegible] have no doubt that it is (as a missionary friend of [illegible] Bulmer, hinted to him it must be) a mere proc[illegible] misconception. Young men among the Kurnai, [illegible] could get wives only by eloping with them on the [illegible] of the women. This may be; an Australian you[illegible] could scarcely ever get a wife except by running [illegible] with her. But how did the elderly men get their [illegible] He appears never to have asked that. But he is [illegible] that there was a system of exchanges. The Kurn[illegible] polygamous, and no doubt among them, as amo[illegible] Australians, the elderly men had, by means of ex[illegible] nearly all the young women for wives. Mr. H[illegible] writes so candidly, and his account of the Kurn[illegible] many respects so interesting, that we should glad[illegible] brought ourselves to think better of this discovery [illegible] But after reading Mr. Fison's most amazing accoun[illegible] origin of marriage by elopement, we find ourselves [illegible] to holding that it is simply a big blunder. Noth[illegible] could have elicited so preposterous an explanation. [illegible] such words as preposterous fall harshly on the ea[illegible] we would part from our authors without unk[illegible] Their exertions to advance a growing science are [illegible] commendable. If the result has been rather to [illegible] than to elucidate, there is but one more illustration [illegible] way in which good intentions, industry, and [illegible] are wasted when men have started in the wrong [illegible]

D. MACLEOD

NOTES

THE evening discourses at the meeting of the British Asso[illegible]tion at York will be delivered by Prof. Huxley and Mr. [illegible]woode. Mr. Huxley will speak of the "Rise and Pro[illegible] Palæontology" on Friday, September 2, and Mr. Spot[illegible] "On the Electric Discharge, its Forms and its Functi[illegible] Monday, September 5.

THE Honorary Fellowship of the Royal College of Sur[illegible] in Ireland was on Wednesday last week conferred on Helmholtz, and the Honorary Degree of LL.D. by the Uni[illegible] of Dublin. On Monday night, at an ordinary meeting [illegible] Royal Society of Edinburgh, Sir William Thomson in the [illegible] Prof. Helmholtz read a paper on "Electrolytic Conduc[illegible] There was a crowded attendance, and Prof. Helmholt[illegible] warmly received.

ON Monday the National Fisheries Exhibition, which [illegible] been organised at Norwich under the care of numerous [illegible] bodies, from the Board of Trade downwards, was opened [illegible] Prince and Princess of Wales. The exhibition is divided [illegible] six classes, as follows:—1. Pisciculture and shell-fish cul[illegible] 2. Models, trawling gear, drifting gear, canvas and rope [illegible] inland fishing tackle; 3. Life-saving apparatus, lamps, fog [illegible] signalling, &c., architectural plans for fish markets, &c.[illegible]

and fishermen's clothing; 4. Pictures, fish and fish refuse as a manure, and polluted streams: 5. Dried, salted, shell fish, fish oils, manure, and disinfected fauna, and birds which prey upon it. In the last class a fine collection late Frank Buckland, which has been of South Kensington Museum. The classes of aquatic, or rather fish eating, eresting and instructive. In the class fish there are a large number of tanks, appliances for hatching the ova of fish, , &c. There are also shown live fish in gal which are specimens of nearly every indigenous to this country, the local nydete. Next week we hope to give the ley, who is now one of the Inspectors of nnection with the Exhibition.

ning Herald we are glad to learn that a it to be established at Watson's Bay, Baron N. de Miklouho-Maclay, on a ined from the Government. d, at the end of February last, of Mr. alian naturalist. Mr. Krefft was born in 1830, and early conceived a taste for pending some time in the United States in November, 1852. Mr. Krefft was e collecting expedition fitted out by the 855. Having succeeded the keeper in e returned to Melbourne with a large and a well-filled portfolio, and was assistant in the Museum. He gave animals obtained and an account of the he aboriginals, illustrated by numerous and his position and returned to Ger- n left home for foreign lands, having ing from Messrs. Godeffroy and Son, th round the world, and after a two- th Africa he took up his quarters in l secretary in the Australian Museum r. Ulard, its curator. On the latter's ent succeeded to the vacant curatorship r years of his appointment he had a with the trustees of the Museum, which his institution, September, 1874. Mr. first man who thoroughly studied the . Krefft was a F.L.S., C.M.Z.S., and learned societies.

AMONG Mr. Murray's forthcoming works are the following:—"The Formation of Vegetable Mould through the Action of Worms, with Observations on their Habits," by Charles Darwin, F.R.S.; "The Life and Letters of the late Sir Charles Lyell, Bart.," edited by his sister-in-law, Mrs. Lyell; "The Land of the Midnight Sun," being a narrative of summer and winter journeys through Sweden, Norway, Lapland, and Northern Finland, by Paul B. du Chaillu, of gorilla fame; also a second and revised edition of Mr. W. H. White's "Manual of Naval Architecture."

AT the meeting of the Sanitary Institute of Great Britain on April 13, Dr. Richardson read a paper of suggestions for the management of cases of small-pox and of other infectious diseases in the metropolis and large towns. Dr. Richardson maintains the thesis that there should be no aggregation of infectious cases in large central institutions, and describes the objections to such aggregation. He suggests further that the sanitary committee or authority in every parish should have all the special centres of infection in each of its districts thoroughly mapped out, and that it should know, on a calculation of cases occurring in quinquennial periods, what is the permanent accommodation required for its infectious sick. He urges that the required accommodation being known, the local authorities should keep ready at all times within the parish such necessary accommodation in small hospitals situated in different parts of the parish or locality. Dr. Richardson described what he thought should be the size, mode of construction, and position of such hospitals:—(*a*) That each hospital should not be larger than is sufficient to receive twenty-four persons at one time. (*b*) That each should be constructed on the separate system for the patients. (*c*) That each should be constructed of iron, so that it may at any time be absolutely purified by fire throughout all its structure. (*d*) That each should be placed on the upper storey of a building, forming in fact the top storey of one or more houses, so that it may be lighted and ventilated directly from its roof. (*e*) That all the air that passes out of the hospital when it is occupied by infectious persons should pass through fire. (*f*) That each patient should be carried into the hospital by a valved lift, which lift should pass through a shaft, so as to draw up air during its ascent, and which should, when required, be effective for flushing the hospital with air. Dr. Richardson entered into the subject of the organisation of these hospitals in respect to general supervision and nursing. Under this head he recommended—(*a*) That the general supervision should be in the hands of the Medical Officer of Health. (*b*) That the nursing, also under the supervision of the Medical Officer of Health, should be carried out by trained nurses, who might be educated to their work in the Union infirmaries. Lastly he suggested that the medical attendance should be conducted by a special staff of duly qualified medical men acting under the Medical Officer of Health and responsible to the local authority, by whom they should be appointed and remunerated. An interesting discussion followed, which was adjourned to the 27th inst.

UNDER the auspices of the National Health Society the following Drawing-Room Lectures will be delivered at 23, Hertford Street, Mayfair (by kind permission of Mr. Charles Matthews), to commence at 4 o'clock p.m.:—Friday, April 22: Prof. Fleeming Jenkin, F.R.S., "Sanitary House Inspection"; Friday, April 29: Dr. Robert Farquharson, M.P. (formerly Medical Officer of Rugby School), "Health in Public Schools"; Friday, May 6: Mr. C. N. Cresswell, "Sanitary Relations of Local Self-Government"; Friday, May 13: Mr. Henry Power, M.B., F.R.C.S., "Care and Education of the Eye"; Friday, May 20: Dr. Siemens, F.R.S., LL.D., "Stoves and Grates"; Friday, May 27: Mr. Ernest Hart, M.R.C.S., "Recent Progress in Health Knowledge." Tickets may be obtained from the

secretary at the offices of the Society, 44, Berners Street, on Mondays and Fridays from 2 to 5, or will be forwarded by post on application. Patronesses: H.R.H. Princess Christian; H.R.H. Princess Louise, Marchioness of Lorne; H.R.H. Princess Mary Adelaide, Duchess of Teck. The president of the Society is His Grace the Duke of Westminster, and the Chairman of Council, Mr. Ernest Hart, M.R.C.S. The objects of the Society are to diffuse sanitary knowledge in every possible way, by the delivery of simple practical lectures on air, ventilation, food, and cookery, the prevention of the spread of infectious disease, and kindred subjects, at working men's clubs, mothers' meetings, and elsewhere, in all parts of London and the suburbs; by the circulation of sanitary tracts and papers; by encouraging the teaching of the laws of health in high schools and Board schools, by offering prizes, &c., to both teachers and pupils; and to secure open spaces for the healthy recreation of the people. Membership is constituted by the payment of 1*l.* 1*s.* annually; life membership by the single payment of 10*l.* 10*s.* Communications to be addressed to Miss Lankester, the Secretary, at the offices of the Society, 44, Berners Street, Oxford Street. It is evident that this Society has adopted effectual means to do a good and highly necessary work; it deserves the heartiest support from all who can in any way lend a helping hand.

Two Art Exhibitions were opened under the auspices of the Sunday Society on Easter Sunday, one at Whitechapel, the other in New Bond Street. That at the East-end consisted of a Loan Collection of Paintings, &c., organised by the Rev. S. A. Barnett, to which the Council on Education contributed largely from the National Collection at South Kensington. More than 2500 persons visited the Exhibition during the day, it being open from 2 till 9 p.m. The West-end Exhibition was the first Exhibition of the new Society of Painter-Etchers at the Hanover Gallery, and this was visited by about 578 members of the Sunday Society between the hours of 4 and 6.30 p.m. On Sunday, April 24, this Exhibition will be open to ticket-holders. Free tickets may be had by all who make a written application, inclosing a stamped and *addressed* envelope to Mr. Mark H. Judge, Hon. Sec. of the Sunday Society, 8, Park Place Villas, W.

THE second series of meetings organised by the Sunday Evening Association at the Neumeyer Hall was brought to a successful close on Easter Sunday by a lecture on "Lessing," by Mr. Moncure D. Conway. The hall was crowded, and at the close it was announced that the first annual meeting of the Association would be held in May, and that in the autumn the Committee intended to organise a series of meetings in the different Metropolitan suburbs, in order if possible to start local branches. The object of the Sunday Evening Association is to bring together all persons who, estimating highly the elevating influence of music and the sister arts, literature and science, desire by means of meetings on Sunday evenings to see them more fully identified with the religious life of the people. The subscription is 2*s.* 6*d.* per annum, which may be paid to the treasurer, Mr. Godfrey Shaen, 15, Upper Phillimore Gardens, W.

WE take the following from the *Electrician*:—The following correspondence over the telephone wires yesterday, says the Kansas City *Times*, is a further proof of the fact that no one but a bald-headed man could do without one:—"Hello, central!" "Hello!" "Connect me with the signal bureau." "All right—go ahead." "Hello, signal!" "Hello!" "Is it going to thaw to-day?" "Yes, there are indications." "How's the wind?" "Getting round to the south." "Do you think I can safely have my hair cut?" "Wait a minute until I consult the barometer, thermometer, and wind gauge." (Silence for half a minute.) "Hello!" "Hello!" "Yes, you can go ahead. There won't be any change to speak of for the next twelve hours. There is a cold wave moving a Ohio River, and a snow-storm is reported at Cheyenne. were you I'd take my chances on the hair-cutting." "—much obliged." "Good bye."

HERSCHEL 3945.—The double-star to
rew attention in NATURE last week on
lists of the components and variability
a longer history than is noted in his
ngle star of sixth magnitude in Bode's
observation, and is Canis Majoris 164.
components on March 2, 1796, magni-
uary 23, 1835, Sir John Herschel,
lls them 7 and 8, "large star orange:
on January 31, 1837, he estimated the
"large star, very high yellow; small,
observations occur in Sweeps 532 and
metrical measures we find for the epoch
nd 7, and for 1837·301 magnitudes 6½
and 8, with the note "Orange and green, fine contrast of
colours." Next we have three meridian observations of the
principal star by Argelander in vol. vi. of the "Bonn Observa-
tions," on January 26 and March 13 and 14, 1854, magnitudes
noted, 5·5, 4·5, and 5·0, and one observation of the companion
on March 23 in the preceding year, when it was estimated 7·5.
In Heis and Argelander the naked-eye estimate is 5 m. The
components are separately noted in Gould's *Uranometria
Argentina* A. 53 red, B. 7. The star does not occur in D'Agelet,
Taylor, or in Argelander's Southern Zones. The mean place
for the beginning of the present year is in R.A. 7h. 11m. 31·80s.,
N.P.D. 113° 6′ 19″·4.

THE TOTAL SOLAR ECLIPSE OF 1878.—In one of the hand-
somely executed volumes which issue from the Government
Printing Office at Washington, the U.S. Naval Observatory has
published the detailed reports of the various expeditions organised
for the observation of the total eclipse of the sun on July 29,
1878, which possess a high degree of interest. A large number
of wood-engravings and lithographic plates accompany the
reports. There is also appended a brief account of the observa-
tions made in California during the total solar eclipse of January
11, 1880.

THE EARTHQUAKE OF NOVEMBER 28, 1880, IN SCOTLAND AND IRELAND[1]

THE data on which the paper has been founded have been collected from upwards of fifty stations, and special reliance may be placed on the results, as a large proportion of these stations were lighthouses, in each of which at the time of the occurrence there was a keeper *on watch*, the earthquake having occurred after sunset at a time when the lamps were lighted.

The paper at the outset gave the effects and nature of the shock experienced by various observers at those lighthouse stations where the disturbance was felt.

The data acquired were then discussed, and the following are the general conclusions arrived at:—

1. That the earthquake occurred in November, a month in which many of the British earthquakes are recorded as having happened.

2. That it occurred after a wet and stormy period, which had been preceded by an unusually dry summer and spring; that there was a widespread thunderstorm at the time, and that the barometer was rising slowly over the greater part of the west of Scotland; the average height of the barometer at the lighthouse stations at which the earthquake was felt being at 9 a.m. 29·4 inches, and at 9 p.m. 29·5 inches. The thermometer at 9 a.m. averaged 50° F., and at 9 p.m. 48° F.

3. That the seismal area was about 19,000 square geographical miles, the shock having been felt as far north as the Butt of Lewis, as far south as Armagh in Ireland, as far east as Blair Athole, and as far west as Barra Head Lighthouse, though how much farther it was propagated into the Atlantic it is impossible to say.

4. That the range of the earthquake or distance to which the wave was propagated was greater over the sea than over the land.

5. That the earthquake was not a simultaneous shake over the disturbed area, but was produced by a wave propagated from a centre.

6. That the undulation seems to have been chiefly of an "up and down" character like a wave of the sea, and that calculating the "breadth" from the mean velocity of transit and the minimum duration of the shock, the wave appears to have been fully 1100 feet "broad."

7. That the observations warrant the assumption that a spot near Philadda Lighthouse (north-east of Colonsay) was the source, and calculating the velocities of transit with a point 13 miles south-south-west of Philadda Lighthouse as a centre, it appears that the wave travelled with a greater velocity over the sea-basin than over the land, probably due to the fact that over the sea there was a thinner and lighter crust to throw into vibration; the average velocity on sea journeys being 6·74 geographical miles per minute, and the average velocity on land journeys 4·65 miles per minute, the mean of the whole being about 5¾ miles per minute.

8. That the source of the earthquake lay at or near the great

[1] By Charles Alex. Stevenson, B.Sc., Edinburgh, communicated to the Royal Society of Edinburgh by Prof. Geikie, F.R.S., March 21, 1881.

fracture of the earth's crust which runs in a south-westerly direction from Inverness.

9. That all the observers who heard the noise agree in stating that it was a "rumbling" sound.

10. That of the fourteen observers within 38 miles of the source who felt the shock, thirteen of them mention having heard the rumbling noise, and none of the other observers in Scotland mention noise as an accompaniment of the earthquake, and hence that the noise was confined chiefly, if not entirely, to places situated near the source.

11. That the stations where the noise was heard were for the most part situated on hard dense rocks, with little or no soil near them.

12. That the average duration of the disturbance was 4·4 seconds for observers situated within the sound area.

13. That of twenty-two lighthouse observers between Cape Wrath and the Mull of Galloway who were situated on the older formations (Laurentian, Cambrian, and metamorphosed Lower Silurian) eleven felt the shock, whilst of thirteen observers situated on newer rocks it made itself known only to two of them, and that the earthquake was therefore more generally felt on the older rocks of Scotland.

14. That stations situated near one another and on the same formation did not necessarily both receive the shock, and that faults and trap dykes did not seem to affect the passage or intensity of the wave in any way.

15. That the observations of time at Armagh, Belfast, and Omagh show that the shocks at these places were most probably propagated direct from Phladda in Scotland, and that the severity of the shock and the "rumbling" noises heard in and around Leterkenny were probably due to a s source of disturbance generated by the arrival Phladda.

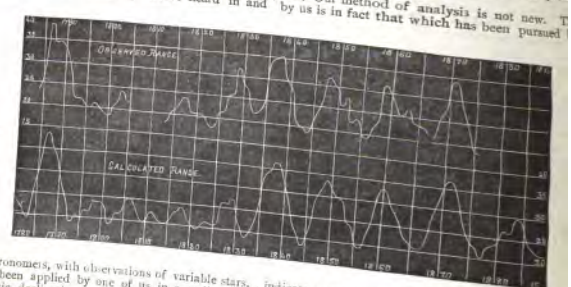
MAGNETIC DECLINATI

1. IT is well known that Prof. Rudolph Wo to render observations of sun-spots made and by different observers, comparable with e thus formed a list exhibiting approximately th activity for each year. This list extends ba teeth century, and is unquestionably of much less it must be borne in mind that we possess sufficiently accurate for a discussion in a co questions relating to solar periodicity befo Schwabe had finally matured his system of which was not until the year 1832.

We have however a much longer series of of magnetic declination. Now these are alre follow very closely all the variations of sun-spo greatest when there are most, and least when spots; and it may even be imagined that such better estimate of true solar activity than derived from the direct measurement of spotte

The long-period inequalities of the diurnal declination are thus, we may imagine, precis activity, so that to analyse the former is prob analysing the latter.

2. Our method of analysis is not new. T by us is in fact that which has been pursued



probably other astronomers, with observations of variable stars, and it has already been applied by one of us in a preliminary manner to magnetic declination ranges (*Proc.* Lit. and Phil. Society, Manchester, February 24, 1880).

3. The observations at our disposal are those which have been used by Prof. Elias Loomis in his comparison of the mean daily range of the magnetic declination with the extent of the black spots on the surface of the sun (*American Journal of Science and Arts*, vol. i., No. cxlix.). These observations are recorded as monthly means of diurnal declination range, and we found it necessary to multiply each by a certain factor, firstly, on account of the well-known annual inequality of declination range, and secondly, to bring them all to the standard of the Prague observations. We have applied for this latter purpose precisely the same corrections as those made by Prof. Loomis.

4. The result of an analysis of these observations has been to indicate the existence of three inequalities: two dominant ones with periods of about 10½ and 12 years, and a subsidiary one with a period of about 16½ years. By these means we have been enabled to reproduce the observed annual values of declination range with an average difference of 39". The amount of agreement between the observed and calculated values will be seen from a diagram which accompanies this note. We are however of opinion that the series of observed values at present obtainable is too short to render this analysis a very accurate one. It will certainly not bear carrying back forty or fifty years beyond its starting-point, which was in 1784, and it would be very hazardous to carry it forward any considerable length into the future. We may however mention that our calculations indicate a maximum of declination range about pronounced a maximum as that of 1871.

5. During our analysis an observation was m we think worthy of record.

It is a well-known fact that the so-called e lations of declination renge are at certain ti other times small. Thus, for instance, they ha the last forty years, but they were small about the present century. It is clear to us from an observations that a series of large oscillations with an exaltation of the base line, or line efficiency, while a series of small oscillations with a depression of the same. The result is a of the base line, the beat period, so to speak yearly inequality.

Now a phenomenon precisely similar occur with shorter periods. If we take inequalities of three or four months we find that such are developed or of large range, and badly develop range; and that a large range of such is accom exaltation of the base line or line of average e small range is accompanied with a depression of result is a curve of the base line, of which the p speaking, eleven years. May we not therefore so-called eleven-yearly period, or, to speak mo

1 "Note on an Attempt to Analyse the Recorded M Magnetic Declination." By Balfour Stewart, M.A., LL Professor of Natural Philosophy at the Owens College, and Read at the Manchester Literary and Philosophical Socie

d a half and twelve-yearly periods into which the eleven- period may perhaps be analysed, may be in reality beat ls for shorter disturbances? Is it not therefore possible study of these shorter periods may give us information ling the nature of the eleven-yearly period, whether for pots or declination ranges, which the small series of actual vations is incompetent to afford?

: beg to take this opportunity of thanking Mr. William d for the help he has given us in this investigation.

UNIVERSITY AND EDUCATIONAL INTELLIGENCE

MBR IDGE.—At Trinity College the following distinguished iates of the College have been elected Honorary Fellows:—Rayleigh, M.A., F.R.S., Professor of Experimental ics; Mr. Henry Sidgwick, M.A., Prælector in Moral and ical Philosophy, the author of "The Method of Ethics"; Edward Herbert Bunbury, M.A., author of "A History of ent Geography," &c.; and Mr. William Henry Waddington, ., Member of the French Institute, late President of the ncil, and Minister of Foreign Affairs in France.

he Adams Prize is to be given in 1883 for a general investi- on of the action upon each other of two closed vortices in a ect incompressible fluid. In particular it is suggested that case of two linked vortices should be fully discussed, with view of determining (1) whether any steady motion is sible, and (2) whether any motion can occur in which there periodical changes in the forms and dimensions of the ices. Each essay should be accompanied by a full and ful abstract pointing out the parts which the author con- rs to be new, and indicating the parts which are to be arded as of more importance than the rest. The competition pen to all graduates of Cambridge; essays must be sent in or before December 16, 1882. Essays must not be written the candidate's own hand. The successful candidate will eive about 170*l*. He must print the essay at his own expense. e examiners are the Vice-Chancellor, and Messrs. A. Free- n, W. H. Besant, and E. J. Routh.

VICTORIA UNIVERSITY.—The following summary of draft gulations on degrees, examinations, and courses of study has en issued:—1. These regulations are, with the exception of tain general proposals with reference to University Matricu- ion, confined to the subjects of Degrees, Examinations, and urses of Study in the Faculties of Arts and Science. 2. cording to the proposals in the Report any certified student a College incorporated in the University may matriculate at tain times in the year, the definition of College studentship ng left to the College or Colleges, subject in each case to the proval of the University. No University examinations leading a degree will be open to any persons who are not matriculated dents. 3. According to the proposals in the Report there e to be two distinct Faculties of Arts and of Science. The grees in these faculties are to be those of B.A. and M.A., Sc. and M.Sc., and a Doctorate common to the two Faculties d varying as a Doctorate of Literature, of Philosophy, and of cience. 4. In consonance with a main principle of the Univer- ty Charter, the degrees of B.A. or of B.Sc. are to be conferred pon students who have passed certain prescribed University xaminations, and who have attended certain prescribed Univer- ty courses of study in a College of the University. 5. In the xaminations for the degrees of B.A. and B.Sc., and in the rivileges conferred by these degrees, a distinction is to be rawn between the Ordinary B.A. or B.Sc. degree, and the .A. or B.Sc. degree with Honours. 6. The regular period of tudy required of candidates for the degrees of B.A. and B.Sc. s to be three years, of which two shall be after the date of their assing the Preliminary Examination (see § 7 of this summary); ut students who have passed the Preliminary Examination (see 7 of this summary) next in date after their matriculation, and ave been placed in the first division of the list of successful andidates, shall be allowed to proceed to their degree in two ears. 7. All candidates for the degrees of B.A. or B.Sc. are equired to pass a general examination called the Preliminary Examination, and to present themselves for this examination not ater than two years from the date of their matriculation. ular st year courses of study are arranged as preparatory is mination, to be taken by all students except those mmediately after matriculation (see § 6 above), or the first year's course of one of the Honours Schools approved by the University. 8. The subjects of the Preliminary Examination are arranged in two groups (A and B), in one of which every candidate must pass. The essential difference between the two groups is that in A, Latin and Greek are compulsory, but that a choice is given between four subjects, including two modern languages and two elementary sciences; while in B a choice is given between the alternatives of two languages (ancient or modern) and one elementary science, or two sciences and one language (ancient or modern). In B the requirements in modern languages and mathematics are rather greater than in A. 9. The other examinations for the degrees of B.A. and B.Sc. will be open to such students only as have passed the Preliminary Examination, and as have attended the prescribed University courses of study in a College of the University. These further examinations will differ for students intending to present themselves for an Ordinary B.A. degree and for those desirous of a B.A. degree with Honours. 10. The degree of B.A. with Honours is to imply that a student has attended, during three years, prescribed courses of study (approved by the University) in a distinct branch of learning or science forming the subject of one of the Honours Schools of the Faculties of Arts and Science, and that he has passed a prescribed examination in such Honours School after attending its third year's course. The Honours Schools recommended in the Report for immediate establishment in the University are those of (1) Classics, (2) English, (3) History, (4) Philosophy, (5) Mathematics, (6) Engineering, (7) Chemistry, (8) Zoology, (9) Physiology, and (10) Geology, Mineralogy, and Palæontology. For all of these Honours Schools the Owens College is prepared to supply classes meeting the proposed requirements of the several Schools. 11. The Ordinary degree of B.A. or B.Sc. is to imply that a student has attended, during at least two years, prescribed courses of study (approved of by the University) forming a connected whole, and that he has passed an examination corresponding to the earlier year's course, to be called the Intermediate Examination, and an examination corresponding to the later year's course, to be called the Final Examination. 12. The courses of study, and the corresponding examinations, prescribed for the Ordinary degrees of B.A. and B.Sc., and open to the choice of candidates who have passed either group of the Preliminary Examination, vary according to the predominance in each course (with its examinations) of one branch of learning or science. This predominance is not however such as to warrant the maintenance of the designations given (for convenience' sake) in the Draft Regulations of "mainly Classical, Historical, English, Philosophical, Mathematical, Engineering, Experimental Science, and Biological." Candidates for an Ordinary B.A. or B.Sc. degree may choose any of these groups, but must go through the whole two years' course, and pass both the examinations of the group chosen. The examinations and classes however largely coincide in particular portions of the several groups. 13. With a view to encourage more advanced study in special branches of learning or science in students whose bent has been determined, or whose capabilities have been developed, at a later stage of their University career, students who have passed the Final Examination for an Ordinary B.A. or B.Sc. degree, are to be allowed to present themselves for examination for a B.A. or B.Sc. degree with Honours, after attending the third, or second and third, year's Honours Course, only in one of the Honours Schools. 14. The degree of Master of Arts or of Science is to be conferred upon Bachelors of Arts of three years' standing, after not less than six years from the date of their matriculation. B.A.s who have graduated with Honours are not to be required to pass any further examination for the M.A. degree; those who have taken the Ordinary B.A. or B.Sc. degree are to be required to pass an examination in some portion of one of the Honours Schools Examinations. 15. The Doctor's degree in the Faculties of Arts or Science is to be conferred upon M.A.s or M.Sc.s who have furnished evidence of special research or learning, to be supplemented when desirable by an examination test.

SOCIETIES AND ACADEMIES

LONDON

Royal Society, March 31.—On the coefficients of ex[pansion] of the iodide of lead, and of an alloy of iodide of le[ad] iodide of silver, by G. F. Rodwell, Science Maste[r] borough College.

The iodide of lead was examined by the speci[al] described by the author in former communications [to] Society, and was found to possess three coefficients of expa[nsion] Between 0° and 205° C. the coefficient of cubical expa[nsion] 1° C. is ·00007614, increasing to ·00008307 between 2[05°] 253° C.

Between 253° and 265° C. the mass expanded very [much] with a coefficient nearly eight times greater than the pre[ceding] viz. ·0006378. After the subsidence of this rapid expa[nsion] coefficient became ·000180. The volumes of the iodide [at] 0° and the fusing point (383° C.) are given, and are [the] curve-table.

Iodide of lead was fused with iodide of silver [in] proportions as to form an alloy containing one [molecule] of each constituent, viz. PbI_2, AgI. This contains [66·2] per cent. of iodide of lead, and 33·80 per cent. of [iodide] of silver. The melting-point of the alloy was found to [be] C., the specific gravity 5·912. On heating it was [found] expand under a very low coefficient between 0° and 11[0°] then it neither expanded nor contracted while heated [to 124°] C.; at 124° C. it commenced to contract, and [continued] between 124° and 139° C. as much contraction as iodide [of lead] itself; again it was stationary for 5° C., and at 144° C. [began] to expand again, with a much higher coefficient than it [possessed] between 0° and 118° C.

The following are some noticeable points about the [alloy]:

1. It possesses similar densities at three different temperatures.

2. Although it contains only 33·8 per cent. of iodide of [silver] it contracts as much during heating as the iodide of silver [alone].

3. While the iodide of silver commences to contract at [145°] C., and terminates at 145°·5 C., the alloy commences to contract 18° C. lower, and terminates its contraction 6°·5 C. lower.

4. The harsh sounds emitted during the cooling of the [alloy] and the tremors simultaneously propagated through its [mass] prove that violent molecular agitation is taking place while [the] iodide of silver is passing from the amorphous plastic condition into the brittle crystalline condition within the mass surrounded by the molecules of the iodide of lead.

5. The fusing-point of the alloy is 33° lower than that of iodide of lead, which constitutes *two-thirds of its weight*; [and] 177° lower than that of the iodide of silver, which constitutes one-third of its weight.

6. And if this is due to the fact that *similar* particles of matter attract each other more powerfully than dissimilar; hence that when the particles of two bodies are mutually [attracted] the attraction becomes less than that of the molecules of [each] one of them singly, and the molecular motion is hence [more] easily assimilated, the same cause may explain the contrast[ed] ment of the phase of contraction on heating the alloy to [a] perature 18° C. lower than that of the iodide of silver [to] it owes this property.

7. If we compare one of the chlorobromiodides of [silver] before described by the author (*Proc.* Roy. Soc., [vol.] p. 295) with the lead-silver iodide alloy, some curious [analogies] present themselves. The alloy, AgI, AgBr, AgCl ([the] discovered as a mineral), contains 41·484 per cent. of [the] silver, and 58·516 per cent. of the chloride and [bromide] silver (which from an expansion point of view may be [regarded] as the same substance, because their co-efficients are [practically] the same). But although the mean coefficients of [expansion] the chloride and bromide scarcely exceed those of the [iodide] lead, and although the chlorobromiodide contains 8 per cent. [more] iodide of silver than the lead-silver iodide alloy, the [amount] *contraction* by heat of the latter is more than twenty times [greater] than that of the former, although we must believe this [effect] be solely due in each case to the presence of the iodide of [silver].

Mathematical Society, April 14.—S. Roberts, [F.R.S.] president, in the chair.—The chairman briefly, but [feelingly] alluded to the loss the Society had sustained by the [recent] of Mr. T. Cotterill, M.A., formerly Fellow of St. [John's] lege, Cambridge, who was for many years a member [of the] Council, and had always taken a warm interest in the [Society].

following communications were made :—On the geodesic ıre of a curve on a surface, Prof. Cayley, F.R.S.—On ive symbols in the differential calculus, Prof. Crofton, .—Note on the resolution in factors of numbers differing ghtly from π, Mr. J. W. L. Glaisher, F.R.S.—On the of the quadric represented by the general equation of the l degree in tetrahedral co-ordinates, and on the five focal ics of a cyclide, Mr. H. Hart, M.A.—The discrimination maximum or minimum path of a ray of light reflected at n curve, Mr. H. M. Taylor, M.A.—On certain tetrahedra lly related to four spheres meeting in a point, and his- l note on Dr. Graves's theorem on confocal conics, the lent.

ysical Society, April 9.—Prof. W. G. Adams in the —Prof. Helmholtz was elected an honorary member of the ty, and Dr. James Moser an ordinary member.—Dr. Gladstone read a note on thermal electrolysis, by himself Mr. Alfred Tribe. The authors found that when sheet- was plunged into fused silver chloride or iodide of silver ıls of silver formed on the sheet. When copper was im- ed in fused cuprous chloride copper crystals deposited on it, hen zinc was placed in melted zinc chloride or iron in melted ıs chloride, these two metals crystallised on the plates. They l this to be due not to a difference in the physical condition of olled metals, but to the unequal heating of the different parts ıe immersed metals. By the contact theory of voltaism will be a difference of potential between the metal and the l chloride in contact with it, and this difference of potential vary with temperature. Since all parts of the immersed l cannot be supposed at the same temperature always, there is ossibility of a current being set up and consequent electrolysis e salt. This view was corroborated by heating the metal un- lly, when a crop of crystals appeared in the cooler part of iquid. Again, two silver rods connected together were ged, the one in a hotter, the other in a cooler part of fused chloride, and at the end of fifteen minutes the latter was Led with crystals of silver, whilst the former was clean. A nometer showed a stronger current between the rods, the er the difference of temperature between the parts of the in which they were placed, and transposing the rods reversed current. These experiments bear on the nature of voltaic n, and form a lecture-illustration of the conversion of heat electricity and chemical force. Mr. W. H. Walenn stated that d found when zinc is immersed in an electro-brassing solution, als of brass (*i.e.*, zinc and copper) were deposited on it.— Abney exhibited a number of photographic negatives n by himself and Col. Festing, by radiation through thin ts of ebonite. The light from the positive pole of an electric was sent through a thin sheet of ebonite $\frac{1}{64}$ inch thick, photographs taken showed the radiation to have a low wave- th, from 8000 to 14,000. The carbon points of the lamp ld be photographed through the sheet, and Col. Festing erved the sun's disk through it. The ebonite showed a grained cture, and different samples of ebonite gave different results, all gave some result in course of time at least; old ebonite, that used in some of Mr. Preece's experiments, scattering the it more than new ebonite.—Dr. Moser exhibited the passage the rays through the ebonite to the audience by means of a vanometer. Prof. Guthrie observed that Capt. Abney had ved that light as well as heat traversed the ebonite, and Coffin stated that the composition of ebonite apparently the ıe might vary considerably, and hence its radiant transparency ght vary too.—Prof. Helmholtz addressed the meeting on localisation of objects by the eyes. We estimate distance h one eye by the outlines of the more distant objects being ered by the nearer ones where they meet, and by the shadows own by the anterior objects. These conditions are very rarely rpowered by others, as, for instance, binocular vision. This shown by Dove's pseudoscope and the fact that closing or ading one eye makes little difference to the power of judging tance, especially when not very close to the eye. The relative fting of objects, as the eye is moved from side to side, or to l fro, or up and down, which may be called the parallax of tion of the head, is also a strong factor in estimating distance. e author had concluded from a study of the stereoscope that the ception of the absolute convergence of our eyes is very indistinct, l that only differences of convergence related to apparently ır or distant objects produce the stereoscopic effect. Recent servations of his show that the incongruity between the degree convergence and the parallax of motion is perceived with great accuracy. Dr. Stone remarked that a person suddenly blinded in one eye acquires a new judgment of distance by moving the head (a habit seen in nocturnal birds), and in taking certain French stereoscopic pictures the camera is shifted to another point, so that the combined images produce an impression of smallness in the object. These facts corroborated Prof. Helmholtz's view; and Mr. Lewis Wright pointed out that santonin, which changes the sense of colour, also appears to change the sense of distance, perhaps by relaxing the muscular sense.

Geological Society, April 6.—J. W. Hulke, F.R.S., vice-president, in the chair.—Edward F. Boyd, Lieut. Herbert de Haga Haig, R.E.; J. C. Margetson, Edward David Price, and James Tonge were elected Fellows of the Society.—The following communications were read :—The microscopic characters of the vitreous rocks of Montana, U.S., by F. Rutley, F.G.S., with an appendix by James Eccles, F.G.S.—On the microscopic structure of devitrified rocks from Beddgelert, Snowdon, and Skomer Island, by F. Rutley, F.G.S.—The date of the last change of level in Lancashire, by T. Mellard Reade, C.E., F.G.S. The author described some observations made by him at Blundellsands, on the coast of Lancashire, near Liverpool, according to which, judging from the position of high-water mark, the land had gained considerably upon the sea between 1866 and 1874. The author adduced evidence in support of his view, and concluded that if the last change of level in South-West Lancashire was a downward one it could not have taken place within 2500 years.

Institution of Civil Engineers, April 5.—Mr. Brunlees, F.R.S.E., vice-president, in the chair.—The paper read was on the actual lateral pressure of earthwork, by Mr. B. Baker, M. Inst. C.E.

EDINBURGH

Royal Society, April 4.—Prof. Balfour in the chair.—Prof. Tait communicated the results of his experiments on the pressure errors of the *Challenger* thermometers, the correction for which, as originally furnished to the expedition, was 0°·5 F. per mile of depth. The mode of experimenting was to subject the thermometers to considerable pressure in a hydraulic press, which was essentially a strong steel cylinder that was warranted to stand a pressure of 25 tons weight on the square inch. It was supported in an upright position upon a strong tripod stand. Water was filled in from above; and into the upper end of the cylinder there was lowered a tight-fitting plug which was fixed in position by a transverse steel bolt. The lower end of the cylinder was connected through a narrow copper tube to a hydraulic pump, which, by pumping in water to the cylinder, raised the pressure to the required amount. At three tons pressure an average effect of 1°·5 F. was produced upon the inclosed thermometers. Before drawing any conclusions as to the correction to be applied in deep-sea sounding, it was necessary to consider how far this effect could be explained as resulting from the peculiar conditions under which the experiments were made. From the known compressibility of glass it was calculated that the volume of the bore of a thermometer tube, closed at both ends, would be diminished by only one-thousandth part for an increase of pressure of one ton weight on the square inch; and from a direct experiment made with a metre-long tube this was proved to represent very approximately the real effect. Hence it was quite out of the question that this could have any appreciable effect on such comparatively short thermometers as those of the *Challenger*, which were besides subject to much graver errors, such as those arising from the shifting of the indices during the ascent from the depths, or even from the effect of parallax when taking the reading. The direct action of pressure may then be disregarded, and the effect produced upon the thermometers in the compression apparatus must be due to secondary effects of pressure, such as evolution of heat. The various sources of heat were four: 1. Heating of the water by compression. This depends greatly on the original temperature of the water, being *nil* at the point of maximum density (40° F.), and larger for higher temperatures. One-fourth of the total effect is due to this. 2. Heating of the water due to pumping in through the narrow tube. This accounts for three-twentieths of the effect. 3. Heating of the vulcanite frame by compression. This explains another fifth. 4. Heating due to the effect upon the protecting bulb. This probably explains the remaining two-fifths of the effect. In this last case however there is not only compression, but distortion; and of the thermal effects of such a strain no one yet knows anything. These four sources of error

cannot be supposed to exist under the conditions in which deep-sea temperatures are taken; and the only other possible source, that namely due to the direct effect of pressure, gives rise to an error which requires a correction of only 0°·04 F. per mile of depth. In the course of the description of experiments Prof. Tait had occasion to describe the various kinds of pressure-gauges which he had found it necessary to devise, the ordinary forms of gauge being altogether useless for scientific work.—Mr. W. W. J. Nicol read a paper on the action of heat on thioformanilide, being an account of experiments he had made in Prof. Hoffman's laboratory at Berlin during the preceding winter.—Mr. Patrick Geddes read the second instalment of his scheme for the classification of statistics. In it he discussed the arrangement of statistics relating directly to the organisms of the society. Three great parallel classes, A, B, C, were formed: A being concerned with the *source* of the organisms forming a community as arising from survival, immigration, and birth; C with the *loss*, from emigration and death; while B contained the biological and social characteristics of the individuals forming a community at any given instant of time. Classes A and B formed the one side and C the other side of the social balance sheet. In treating of occupations the same three classes appeared again: A dealing with operations on matter and energy, B with services rendered to society (including education, government, &c.), and C forming the class of the essentially unproductive, *e.g.* the unemployed, the disabled, the destructive, &c. The question of partition, both mediate and ultimate, amongst the organisms of matter and energy fell next for discussion; and this led on to the final classification of uses made after partition, in all of which it was shown that the classification fitted naturally into the three original classes, A, B, and C, indicated above. In a future paper Mr. Geddes hoped to demonstrate the *practical* value of his system.

VIENNA

Imperial Academy of Sciences, April 7.—L. Fitzinger in the chair.—The following papers were read:—Dr. G. Becka, on the orbit of the "Ino" planet (No. 173).—Dr. E. Ludwig, on a new method for the quantitative determination of uric acid.—Dr. D. Dublier, on the influence of continual use of carbonate of soda on the composition of the blood.—Dr. James Moser, electrostatic investigations especially into the ramification of induction on the differential inductometer and electrophorus.—Dr. Moritz Holl, on the blood-vessels of the placenta of man.—L. Haitinger, on nitro-olefines.

Imperial Institute of Geology, March 15.—E. Kittl, on a recent find of Listriodon (found at Nussdorf, near Vienna, in 1879).—Dr. E. Mojsisowics, on the cephalopod-fauna of the Triassic formations at Mora d'Ebro, in Spain.—K. M. Paul, on the occurrence of ozokerite and petroleum at Boryslaw (Gallicia).

April 5.—E. Kittl, on Bohemian spas.—Baron H. Fullon, observations on crystallisation.—Dr. V. Hilber, on the terminal stratifications of gypsum in Eastern Gallicia.

PARIS

Academy of Sciences, April 11.—M. Wurtz in the chair.—The following papers were read:—On peroxide of ethyl, by M. Berthelot. This may be prepared by sending through anhydrous ether, for several hours, a slow current of quite dry and strongly ozonised oxygen. The formation of oxygenated water by action of ozone on ether is not immediate, but by destruction of a first compound, viz. peroxide of ethyl. This substance is a sesqui-oxide $C_{16}H_{20}O_6$.—On the Eulerian integral of the second species, by M. Gyldén.—Researches on the liquefaction of gaseous mixtures, by MM. Cailletet and Hautefeuille. Operating with a gas easily liquefiable and a so-called permanent gas, in capillary tubes, total liquefaction (yielding a homogeneous liquid) is obtained by first compressing the mixture at a temperature so high that the strongest pressures prove powerless to abolish the gaseous state, then lowering the temperature regularly, so that all points of the tube pass at the same time through the temperature at which is produced a change of state. The authors thus obtained condensed carbonic acid, holding a large proportion of oxygen, hydrogen, or nitrogen, these latter substances concurring to form the liquid, though the temperature was too high for them to exist separately in that state. The results of experiment with cyanogen and carbonic acid are analysed. The assimilation (generally very imperfect) of solution of a gas to its liquefaction probably here applies. The mixture retains its characters at temperatures considerably above that corresponding to the point of its less easily liquefied element.—On the [illegible] the sun, by Mr. N. Lockyer. He shows reason for [illegible] iron does not exist in the heart of the sun, but only [illegible] tuents, and these exist at different levels in the sun's [illegible] and produce more complex forms by condensation.—On [illegible] attacked by a champignon, by MM. Cornu and [illegible] The insect belongs to the cycle of development of [illegible] *rubra*, which produces the red galls of elm. The [illegible] *Pleospora*; it attacks the dead puceron. It is probable [illegible] of affecting much the multiplication of phylloxera.—[illegible] integration of linear equations by means of Abelian [illegible] by M. Poincaré.—On formulæ of representation of [illegible] by M. du Bois-Reymond.—Study of the vapour [illegible] drate of ammonia, by M. Isambert. The substance [illegible] volatile in presence of its elements than *in vacuo*, [illegible] gas such as hydrogen.—On chlorides, bromides, and [illegible] sulphur, by M. Ogier. A thermo-chemical study [illegible] development of *Tricuspidaria nodulosa* or *Trichocephalus* of Rudolph, and on its cysticercus, by M. Mégnin. [illegible] perches of the Seine are greatly affected by the [illegible] present.—Studies on some points of the anatomy of [illegible] *scutata*, by M. Rietsch.—On the different species [illegible] whose remains are buried in the cavern of Lherm (Ariège), by M. Filhol. Remains of an enormous *Ursus* [illegible] rently) have been found among about 100 bones [illegible] *spelæus*. M. Filhol doubts the descent of the former from the latter. He supposes that *Ursus arctos*, [illegible] distant regions (perhaps North America), gradually [illegible] was substituted in our countries for *Ursus spelæus*. [illegible] ments of a new type of bear have been found in this cave; author names it *Ursus Gaudryi*. The fossil femur of a [illegible] mous lion has also been found.—Production of [illegible] silicate of baryta in crystals, by M. Le Chatelier. The [illegible] on the inner surface of vessels of baryta water [illegible] uncleaned a long time.—On the production of a [illegible] phosphide of iron and of anorthite felspar in the [illegible] Commentry coal-pits, by M. Mallard.—On the [illegible] Seine during the winter of 1881, by M. Lemoine. [illegible] at Paris has been pretty high from the middle of January [illegible] middle of March. Usually (as M. Belgrand has [illegible] maximum of flood at Paris is due to the waters of [illegible] rivers mostly in the upper part of the valley and [illegible] impermeable strata. But last winter, it is chiefly [illegible] nearest Paris, those of Brie, that, by their quite unusual [illegible] have brought on the maximum (which has therefore [illegible] great rapidity). The subsoil of La Brie is like a [illegible] when it is gorged with water the least rain causes [illegible] floods.

LIGHTNING CONDUCTORS.

Experience, accumulated since the time of Benjamin Franklin, proves conclusively that a Conductor made of Copper of adequate size is the best of all appliances for the protection of every description of building from the destructive effects of lightning.

NEWALL & CO.'S
PATENT COPPER LIGHTNING CONDUCTOR,

As applied to all kinds of Buildings and Shipping in all parts of the world with unvarying success: is the most Trustworthy, most Effective, and also the Cheapest Conductor ever offered to the public.

It is simple in its application, no insulators being required, and it costs only one shilling per foot for the standard size, which ensures safety in any event.

NORTH BRITISH AGRICULTURIST

is the only Agricultural Journal in Scotland, and circulates extensively amongst Landed Proprietors, Factors, Farmers, Farm-bailiffs, and others interested in the management of landed property throughout Scotland and the Northern Counties of England.

The AGRICULTURIST has also a very considerable circulation on the Continent of Europe, America, Australia, and the Colonies.

The AGRICULTURIST is published every Wednesday afternoon in time for the evening mails, and contains Reports of all the principal British and Irish Markets of the week, besides Telegraphic Reports of those held on the day of publication.

The Veterinary Department is edited by one of the leading Veterinarians in the country, and is invaluable to the breeder and feeder as a guide to the rearing of animals, and their treatment when labouring under disease.

Full Reports are given of the Meetings of the Royal Agricultural Society of England, the Royal Agricultural Society of Ireland, the Highland and Agricultural Society of Scotland, the Scottish Chamber of Agriculture, and all the principal Agricultural Associations throughout Great Britain and Ireland.

For Advertisers addressing themselves to Farmers a better medium does not exist

THE

NITHOLOGICAL LIBRARY

OF THE LATE

SIR WILLIAM JARDINE,

NET OF JARDINE HALL, LOCKERBEE, N.B.,

just come into my possession. It includes the following Valuable Books:—

D'S Birds of EUROPE, 5 vols.
D'S Birds of AUSTRALIA, 7 vols. and Supplement.
D'S Birds of ASIA, *as far as out.*
D'S Birds of GREAT BRITAIN, 25 parts.
D'S Partridges of AMERICA, 3 parts.
BON'S Birds of North America, 4 vols. elephant folio; and 5 vols. of text.
and MITCHELL'S Genera of Birds, 3 vols. folio.
IS, a COMPLETE SET *from the commencement.*
SACTIONS of the ZOOLOGICAL SOCIETY, 10 vols. 4to. *A plete set.*
EEDINGS of the ZOOLOGICAL SOCIETY, 33 vols. 8vo. *A plete set.*
ON, Planches Enluminées, 5 vols. folio of 1008 *Coloured Plates of rds.*
MINCK ET LANGIER, Planches Coloriées, 5 vols impl. 4to. *coloured plates of Birds.*
MARS, Iconographie Ornithologique, 1 vol. impl. 4to.
TER and SALVIN'S Exotic Ornithology, 1 vol.
ER'S Birds of New Zealand, 4to.
HERBE, Histoire nat. des Piscidés, 4 vols., large folio.
OLD'S Birds of Japan, folio. *An early coloured copy.*
EVILLE, Revue de Zoologie. 31 vols. 8vo. from the commencement.
E EDINGS of the PHILADELPHIA ACADEMY of NATURAL ISTORY, 16 vols. *from the commencement.*
ON and BONAPARTE'S Birds of North America. 13 vols. folio. *e original Philadephia edition.*
CK'S British Birds and Quadrupeds, 3 vols. 8vo.
ER'S British Birds, 4 vols. folio.
S Birds of Brazil, 2 vols. folio.
Y'S British Ornithology, 2 vols. atlas folio.

☞ ALL CHOICE COPIES, WITH UNCUT EDGES.

ther, the ORNITHOLOGICAL WORKS of Azara, Bird, Baldamas, tein, Belanger, Blyth, Bonaparte, Cabanis, Cassin, Decken, Eyton, , Hartlaub, Heuglin, Hume, Jerdon, Lesson, Marshall, Pallas, Rüppell, , Sharpe, Schlegel, Sclater, Swainson, Temminck, Vieillot, Yarrell, n; the Ornithological portions of the great Scientific Voyages and ditions; Ornithological Journals, &c., &c.
pecial CATALOGUE of Sir WILLIAM JARDINE'S LIBRARY is in *prepara-* and will be forwarded *gratis* on application.
ady now are the following CATALOGUES of my extensive stock of s on NATURAL HISTORY:—

I. General Works, Collections, Scientific Voyages, the Palæarctic Region, Europe. Price *2d.*
II. The Palæarctic Region: the British Isles. Price *4d.*
III. " " North and West Asia, China, Japan, North Africa, Egypt, and North-East Africa, and Natural History Works, arranged in CLASSES. Price *1s.*
IV. The Ethiopic Region, the Oriental Region, the Australian Region, the Nearctic Region (North America), the Neotropical Region (South America). *6d.*

BERNARD QUARITCH, Bookseller, 15 Piccadilly, London.

The leading Farmers' paper."—CLARE SEWELL READ, ESQ., M.P.

THE CHAMBER OF GRICULTURE JOURNAL

AND FARMERS' CHRONICLE

(PRICE *3d.* WEEKLY).

he representative organ of the Central and Provincial Chambers of iculture; *gives fuller reports of the discussions and proceedings* of extensive organisation than any other agricultural paper. It devotes *ial attention to the treatment of Agricultural Questions by Parlia-t*, besides containing ample Reports of the LATEST LONDON and UNTRY CORN, CATTLE, HOP, PROVISION, and other Markets, Original Articles on Practical Farming, the Dairy, Herd and Flock ws, Horticulture, &c., &c. It is despatched every Monday evening in for the country post.
'erms of Subscription, payable in advance, post free:—3 months, *3s. 9½d.*; months, *7s. 7d.*; 12 months, *15s. 2d.*

THE SCIENTIFIC RESULTS OF THE VOYAGE OF H.M.S. "CHALLENGER."

Now ready, ZOOLOGY, Vol. II., Copiously Illustrated, in royal 4to, price *50s.*

REPORT on the SCIENTIFIC RESULTS

of the VOYAGE of H.M.S. "CHALLENGER" during the YEARS 1873-6, under the Command of Capt. G. S. NARES, R.N., F.R.S., and Capt. F. T. THOMSON, R.N. Prepared under the Superintendence of Sir C. WYVILLE THOMSON, Knt., F.R.S., &c. Provisional Title. ZOOLOGY, Vol. II.

*** This Volume may be had also in Two Separate PARTS, being Parts VII. and VIII. of the entire work as follows:—

PART VII. *Report on the Corals*, by H. N. MOSELEY, M.A., F.R.S., &c. Price *15s.*

PART VIII. *Report on the Birds*, by Dr. P. L. SCLATER, F.R.S., with the assistance of the late Marquis of Tweeddale, F.R.S., Dr. O. Finsch, C.M.Z.S., Prof. Salvadori, C.M Z.S., W. A. Forbes, F.Z.S., O. Salvin, F.R.S., H. Saunders, F.R.S., and the late Prof. Garrod, F.R.S. Price *35s.*

*** Published by Order of H.M. Government, and Printed for H.M. Stationery Office.

ZOOLOGY—Vol. III., containing Memoirs on the *Echinoida*, by Prof. AGASSIZ; and on the *Pycnogonida*, by Dr. HOEK, is nearly ready.

London: LONGMANS & CO, JOHN MURRAY, MACMILLAN & CO., SIMPKIN, MARSHALL, & CO., TRÜBNER & CO., E. STANFORD, J. D. POTTER, and C. KEGAN PAUL & CO. Edinburgh: A. & C. BLACK and DOUGLAS & FOULIS. Dublin: A. THOM & CO., and HODGES, FIGGIS & CO.

TEXT-BOOKS OF SCIENCE.

In small 8vo, with 372 Figures on Wood, price *6s.* cloth.

SYSTEMATIC MINERALOGY. By

HILARY BAUERMAN, F.G.S., Associate of the Royal School of Mines. (Forming one of Messrs. LONGMANS & Co.'s Series of Text-Books of Science, Mechanical and Physical, Edited by C. W. MERRIFIELD, F.R.S.)

London: LONGMANS & CO.

NEW WORK BY LIONEL S. BEALE.

Now ready, pp. 230, *demy* 8*vo*, *5s.*

SLIGHT AILMENTS:

THEIR NATURE AND TREATMENT.

By LIONEL S. BEALE, M.B., F.R.S., F.R.C.P.,

Professor of the Principles and Practice of Medicine in King's College, London.

J. & A. CHURCHILL, New Burlington Street.

New Edition, very much enlarged, *21s.*

HOW TO WORK WITH THE MICROSCOPE.

By LIONEL S. BEALE, F.R.S.,

President of the Royal Microscopical Society.

THE FIFTH EDITION,

Strongly bound and enlarged to 530 Pages, with 100 Plates, some of which are Coloured, is now ready.

HARRISON & SONS, Pall Mall.

Just issued, price *5s.*, handsomely bound in cloth, with Portrait of Author.

MIND IN ANIMALS. By Prof. Ludwig

BÜCHNER. Translated by ANNIE BESANT.

"It is a decidedly valuable addition to the literature of Comparative Psychology."—*Nature.*

ble professions.

inently a soldier of science, his
as been unwavering and life-long,
e has been a noble struggle for the
secrets. Born on March 31, 1811, at
father was Professor of Theology,
that ancient University before he
is teens, and published an inaugural
ratio ac descriptio hygrometrorum."
he age of twenty-two, he became a
university of his native town thus
a teacher, which he has consistently
ainous success for close on half a
Bunsen became Professor of Che-
chnic School in Cassel; in 1838
o the Chair of Chemistry in the
g, where he remained for thirteen
e was for a short time at Breslau,
to Heidelberg, of which renowned
on one of the chief ornaments and
thirty years.

ntific investigation was one which
ention, and the results of which are
ance. In conjunction with Berthold,
ogen, he showed that moist freshly
droxide acts as a certain antidote in
arsenic, provided that it is exhibited
and early enough in the history of
lonation of this action is the for-
uble ferrous arsenite: 100 parts of
carry down from five to six parts
known and valued is this anti-
or it is kept by apothecaries ready

scribed some singular compounds
yanides form with ammonia. He
neral statement (that ammonium
ed by boiling prussian blue with
ed that it is formed by digesting
lead ferrocyanide with ammonium carbonate. He also measured the angles of crystals of many of the double cyanides.

In 1837 he struck the first note of one of his most important and fruitful investigations in a memoir on the existence of arsenic as a constituent of organic bodies. In the year 1760 the French chemist Cadet had observed that a mixture of acetate of potash and white arsenic yields, when heated, a heavy brownish-red liquid, which has a frightful smell and fumes strongly in the air, and this liquid was termed Cadet's fuming arsenical liquid. Little more than the fact of its existence was ascertained concerning this body until Bunsen undertook its examination, and in a series of memoirs which have now become classical, and which extended over many years, placed its composition in a true light, thus giving to the world the first member of the now well-known family of the organo-metallic bodies.

Bunsen showed that Cadet's liquid, as well as its numerous derivatives, contains a radical having the formula C_2H_6As, and that this substance in its chemical relations exhibited striking analogies with a metal, being indeed, as he terms it, "a true organic metal." He succeeded in isolating this body, and this discovery formed not only the starting-point for the preparation of hundreds of other similar bodies, but also contributed largely to the development of one of the most important of our chemical theories, that of compound radicals. This body, like most of its compounds, possesses a most offensive odour, so much so that the air of a room containing a trace of the vapour is rendered absolutely unbearable. Hence to this substance Bunsen gave the name of Cacodyl (κακόδης, a bad smell). Not only however are these compounds unpleasant, but they are highly poisonous, very volatile, dangerously explosive, and spontaneously inflammable. It is difficult enough nowadays for a chemist to work with such substances armed as he is with a knowledge of the danger which he has to encounter, as also with improved appliances of every kind to assist him in overcoming his difficulties. But Bunsen forty years ago was a traveller in an unknown and treacherous land, without sign-posts to guide him, or more assistance on his journey than was furnished by his own scientific acumen and his unfaltering determination. Nor did he escape scot-free from such a labour, for in analysing the cyanide of cacodyl the combustion tube exploded, Bunsen lost the sight of an eye, and for weeks lay between life and death owing to the combined effects of the explosion and the poisonous nature of the vapour. "This substance," he writes, "is extraordinarily poisonous, and for this reason its preparation and purification can only be carried on in the open air; indeed, under these circumstances it is necessary for the operator to breathe through a long open tube so as to ensure the inspiration of air free from impregnation with any trace of the vapour of this very volatile compound. If only a few grains of this substance be allowed to evaporate in a room at the ordinary temperature, the effect upon any one inspiring the air is that of sudden giddiness and insensibility, amounting to complete unconsciousness."

Taking a totally different direction, Bunsen's next important investigations were concerned with the examination of the chemical changes which occur in the blast-

furnace. In 1838 he proved, by accurate analyses of the gases escaping, "that at least 42 per cent. of the heat evolved from the fuel employed is lost, and that in view of the ease with which such combustible gases can be collected and led off to a distance for subsequent use, a new and important source of economy in the iron manufacture is rendered possible." This research is however not only noteworthy as pointing the way to a method of economical working without which probably but few iron-masters at the present day could exist, but also as being the first experiment in which an accurate method of gas-analysis was employed. This important branch of analytical chemistry has been created and brought to its present wonderful degree of precision solely by the head and hands of the Heidelberg experimental philosopher. Simplicity and accuracy constitute the rare merits of Bunsen's system of gaseous analysis. To have gone completely through his course of gas analytical manipulations from the sealing-in of the platinum wires in the eudiometer to the absorption- and explosion-analyses of the Heidelberg coal-gas, under the eye and with the guilding help of the hand of the master, is in itself an experimental education of no mean order. But it is only on reference to his "Gasometric Methods" that we learn the general adaptability of this marvellously accurate system to all those numerous problems in which the analysis of a mixture of gases is required.

Next in order (1841) comes the invention of the Bunsen battery, an invention which has proved of the greatest practical value to mankind, inasmuch as this form of battery is now very largely used all over the world, not only as a scientific instrument, but also for ordinary telegraphic purposes. The chief point in this invention consists in the employment of carbon as the negative pole in place of copper or platinum. In his first communication on this subject, Bunsen accurately measures the absolute intensity of the current from his zinc-carbon battery, and compares it with that of a Grove (zinc-platinum) battery, invented a short time before by Sir William Grove.

Bunsen's next great achievement consists in the investigation from both the chemical and the physical point of view of the volcanic phenomena of Iceland. The several memoirs on this subject are the result of a visit to Iceland in 1847. They consist, in the first place, of a careful and extended series of analyses giving the average composition of the volcanic rocks of different ages occurring in the island, upon which he founded a most important and very general theory of volcanic action, a theory which he has since proved is applicable to the formation of other volcanic rocks of widely different origin, both as regards time and locality. This theory consists, to begin with, in a proof that all the Islandic rocks, of whatever age, may be considered as mixtures in varying proportions of two normal silicates, the trachytic and pyroxenic. In the first of these (an acid silicate) the relation of the oxygen of the acid to that of the bases is as 3 : 0·596, whilst in the latter (a basic silicate) the relation is as 3 : 1·998. This result, accompanied by an experimental proof that the melting-point of different bodies is differently raised under increase of pressure, led Bunsen to assume that a crystallisation of these two normal silicates occurs in the earth's interior, and that all the eruptive rocks which reach the surface consist either [illegible] other of these or of mixtures of the same. In [illegible] place they contain a full and successful research [illegible] so-called pseudo-volcanic phenomena of Iceland; he investigates the formation of zeolites and other [illegible] line minerals by the joint action of heat, acid [illegible] moisture on the volcanic rocks. He also examines [illegible] composition of the fumerolle gases as well [illegible] issuing from the crater of Hecla, and explains [illegible] of the changes effected by these gases on the [illegible] ing rocks. Lastly, he investigates the far-famed Geyser, and places the cause of the periodic [illegible] boiling water on its true physical basis. His [illegible] observations on the spot, first as to the [illegible] the geyser-tube, then as to its mode of formation; finally, his thermometric measurements of the temperature of the water-column taken a few moments the eruption and at different depths, disposed [illegible] of what may be called the old tea-kettle theory showed indisputably that in no part of the tube water reach the temperature of ebullition under [illegible] sure of the superincumbent column, whilst the [illegible] quiescent, but that when the geyser column is [illegible] the rush of steam from the volcanic vents at the [illegible] the boiling-point of the water at each point of the [illegible] thus raised is reached, and "the whole mass [illegible] middle downward suddenly bursts into ebullition; water above mixed with steam-clouds is projected into atmosphere, and we have the Geyser eruption in [illegible] grandeur. By its contact with the air the [illegible] cooled, falls back into the basin, partially refills the [illegible] in which it gradually rises, and finally fills the tube before. Detonations are heard at intervals, and [illegible] of the water in the basin. These are so many attempts at an eruption, for not until the water in the tube comes sufficiently near its boiling-point to allow lifting of the column effective can we have an eruption" (Tyndall).

To do justice to all the contributions with which [illegible] has enriched our science would fill several numbers of NATURE, and to many of them the writer must [illegible] himself with a mere cursory reference. One of his favourite and fruitful themes was the preparation by electrolysis of the rarer or more difficultly [illegible] metals. This is one of the purposes for which he employed his battery. Metallic magnesium was [illegible] the first of his preparations of this kind, and in the description of this preparation his fertility of resource is clearly seen. Metallic magnesium in the molten state is specifically lighter than the fused *mixture of salts* from which it is obtained. Hence as soon as a globule of the metal is formed, it rises to the surface, and there takes fire and burns. To obviate this difficulty the carbon vessel in which the metal was formed was serrated, and the globule on rising was caught, below the surface of the fused salts, in one of a series of small pockets, and thus prevented from burning.

Then followed the reduction of chromium, aluminium, and, in conjunction with the late Dr. Matthiessen, of the alkaline-earth metals, and more recently by Hillebrand and Norton, of the metals of the [illegible] group. These electrolytic researches are marked by the thoroughness and completeness which is characteristic

nsen's work. He seeks for the explanation of that hitherto the reduction of these metals electric current had proved a failure, and he in what he terms the density of the current, electromotive force divided by the area of the power of the current to overcome chemical ncreasing with its density. Thus if a constant ɔe led through an aqueous solution of chromic , the result as to whether hydrogen is evolved, and chromium, or whether metallic chromium is d, depends upon the area of the pole through ıe current passes into the liquid.

were these experiments made merely for the of preparing the metals in question. Thus the magnesium was pressed into wire and used in the series of photo-chemical researches, to which :e will hereafter be made, for the purpose of g an interesting conclusion respecting its light-power on combustion, and comparing this with ıal and chemical brightness of the sun, a compari- ıich led to the commercial manufacture of this by the Magnesium Metal Company, and to the listribution and general use of this metal as an ıating agent of great brilliancy. Thus again the lytic preparation in the Heidelberg laboratory of ınt masses of cerium, lanthanum, and didymium, e further object of the determination of the specific ɔf these metals by help of the now well-known d with Bunsen's ice-calorimeter, by means of which nination the true atomic weights of these metals ıe proper formulæ of their oxides and compounds been definitely ascertained.

e Bunsen battery has however not only been of :e in inorganic chemistry, but has thrown clear upon the constitution of organic bodies. The clas- researches of Kolbe on the electrolysis of acetic and the other fatty acids were carried out in the ɔurg laboratory, and owe their inspiration to Bunsen. subsequent equally important labours of Kolbe Frankland, and those of the latter chemist alone, he isolation of the organic radicals, have a like n.

mongst the numerous physico-chemical investigations :h Bunsen has carried out, none perhaps show more rly the fertility of his experimental ability than the in which he describes the ice calorimeter, and another ɔted to an explanation of a new method of determining ɔur densities. Translations of these memoirs are ıd in the *Philosophical Magazine* for 1867 and 1871, may be taken as typical of his calorimetric re- rches.

ınother group of researches is formed by those which closely related to his gasometric methods. One of the st interesting and important of these refers to the law absorption of gases in water. This subject was first ımined by Dalton and Henry at the beginning of the ıtury, and the well-known law which gases follow in sorption is known by the names of these two Manchester ilosophers. But although generally admitted, its limits error had not been ascertained, and the crude experi- ental methods of the year 1803 required to be replaced y the refined ones of the latter half of the century. 'hese researches, carried on by Bunsen and by several of his pupils, proved that Henry's law of direct—as well as that of Dalton of partial—pressures is exactly true within certain limits; but ceases to be so beyond a given increase of pressure, whilst some gases which obey the law at one temperature do not do so at others, and some again whilst obeying it in the pure state, do not do so when mixed with other gases.

The mere mention of his other researches in the wide field of gaseous chemistry is sufficient to indicate his devotion to this branch of experimental inquiry. We find experiments on laws of gaseous diffusion, on applications of gaseous diffusion in gasometric analysis, on the phenomena of the combustion of gases, on the temperature of ignition of gases, and all these, be it remembered, involving exact measurement, and in many cases elaborate calculations.

Brief reference must next be made to a series of investigations in a totally different direction, viz. on the measurement of the chemical action of light, with the carrying out of which the writer of this article had the great good fortune and pleasure to be connected, and in which he had full opportunity of admiring Bunsen's untiring energy and wonderful manipulative power. In all the difficulties and perplexities by which the experimental investigation of such a subject is beset, the writer never knew Bunsen discouraged or at a loss for an expedient by which an obstacle could be overcome. Cheerful and self-reliant under the most depressing circumstances, he never gave up hope, and thus it was that these somewhat intricate and difficult investigations were brought to a successful close.

Again, in the department of Analytical Chemistry how numerous and valuable have been his contributions! There is scarcely one important problem in this subject which has not benefited from his extensive experience and keen insight. Bunsen's methods of silicate analysis, of mineral water analysis, and a dozen of other complicated laboratory processes, are simply perfect. Then his original method for the estimation of nitrogen in organic bodies will always be remembered as one of the most accurate of its kind when employed by an experimentalist as expert as Bunsen himself, but as most difficult and even dangerous in less able hands. Again, all chemists use and appreciate the much simpler methods for the estimation of nitrogen and sulphur admirably worked out by his pupils—Maxwell Simpson and Russell.

We all employ his beautiful general method of volumetric analysis, but chemists do not always remember that in this research Bunsen first determined the exact percentage composition of the higher oxide of cerium, a determination of the greatest scientific importance as regards the chemistry of the metals of the rare earths. Moreover they may be apt to forget that Bunsen was the first to introduce a general method of the separation of these rare earths, by which he for the first time prepared pure yttria and erbia, and by which subsequently, in the hands of other chemists, many new metals have been discovered. His well-known method of flame-reactions is a standard example worked out by every student. Again, modern chemists can now scarcely carry on the simplest experiment without using the "Bunsen gas-lamp," a burner which is also now employed in every household, and in many manufactories,

and has become so necessary that it is difficult to conceive how we worked before its invention. To him we are also indebted for the apparatus for accelerating filtration, the "Bunsen-pump," together with all its appliances, now employed in every laboratory.

Of all the contributions to the advancement of our science, that by which the name of Bunsen has, however, become best known, and by virtue of which future generations will place him on the highest pinnacle of experimental fame, is the foundation, with his no less celebrated colleague Kirchhoff, of the science of Spectrum Analysis, and the discovery by its means of the two new alkali metals, cæsium and rubidium. It is true, of course, that many facts were ascertained and many observations made relating to the power possessed by matter in the state of incandescent gas emitting rays of a peculiar and characteristic kind. Few great discoveries are made at one step. But the glory of having established a new branch of science, of having placed "Analysis by Spectrum Observations" on a sound and firm experimental basis, belongs to the Heidelberg philosophers, and to them alone.

The history of the establishment of spectrum analysis, as that of its enormous recent developments, is too well known to the readers of NATURE to require repetition. All that is necessary here is to recall the masterly way in which Bunsen worked out the properties and showed the relationships of the new metals and their compounds. He first saw the cæsium lines in a few milligrams of the alkaline residue obtained in an analysis of the Dürkheim mineral waters, and the discovery of a second new metal (rubidium) soon followed that of the first. So certain was he of the truth of his spectroscopic test that he at once set to work to evaporate forty tons (44,000 kilos) of the water, and with 16·5 grammes of the mixed chlorides of the two new metals which he thus obtained, he separated the one metal from the other (no easy task) and worked out completely their chemical relationship and analogies, so much so that the labours of subsequent experimenters have done little more than confirm and extend his observations; such a result is truly a marvel of manipulative skill!

Another less widely known, but no less interesting and important research, is that on the spark-spectra of the metals contained in cerite and other rare minerals. In this he shows his power both as physicist and chemist. He first describes a new chromic-acid battery suited to the performance of the special experiments which he afterwards details. He determines with great care all the physical constants of this battery, and then proceeds to investigate the spectra of the earths which give no colour to the non-luminous flame. The spark-spectra of these earths he carefully maps, so completely, indeed, that the separation and identification of these metals now for the first time became possible.

The many hundreds of pupils who during the last half-century have been benefited by personal contact with Bunsen will all agree that as a teacher he is without an equal. Those who enjoy his private friendship regard him with still warmer feelings of affectionate reverence. All feel that to have known Bunsen is to have known one of the truest and noblest-hearted of men.

JAPAN

Japan, nach Reisen und Studien im Auf... Preuss. Regierung dargestellt. Von J. ... fessor der Geographie in Marburg. Erst... Natur und Volk des Mikadoreiches. (Leip... mann, 1881.)

Notes and Sketches from the Wild Coasts of N... Capt. H. C. St. John, R.N. (Edinburgh ... 1880.)

THE present year has already brought tw... tributions to the rapidly increasing stock o... literature in "Japan, nach Reisen und Studien... Rein of Marburg, and "The Wild Coasts of N... Capt. St. John. The two works thus thrown to... tion by subject and time of publication have ... nothing else in common.

Had Capt. St. John's book been written a fe... rations ago, or had it related to a country ... unexplored, it would have possessed a great ... upon popular interest; but Japan has in late ye... so far the object of careful study by residents ... descriptions by tourists, that the *raison d'être* ... Wild Coasts of Nipon" is not easy to perceive.

In the preface the reader is assured that ev... stated in the text, with a few exceptions, ... under the observation of the author, and ... doubt that he has scrupulously confined himself ... own personal experience, without seeking to ... augment it by reference to other sources. The ... of such a limitation of matter must however ... altogether upon the extent of the experience ... special qualifications of the observer, and ... opinion that had the author taken the trouble to ... what his predecessors have already made kn... would have largely altered his notes.

The author as a sportsman and naturalist dis... self in a more favourable light than as a ke... observer. His sporting memoranda are am... give a character to the volume, while as a ... naturalist he shows more than average knowl... contributes some interesting facts on the subje... animal kingdom. In the flora he is on less secure ... and on one occasion, at page 137, confuses ... least, two such well known trees as the Hinok... *spora obtusa*) and the *Cryptomeria Japonica*.

In his remarks upon the people he bears test... to the simplicity and kindness of the peasantry, ... must have seen a good deal. Unfortunately, for ... unlearned in the language, and chiefly dependent ... entertainment upon ordinary tea-houses, he ha... rashly ventured into generalisations requiring ... that very few foreigners possess. At page ... Japanese men, as a race, are said to be "... muscular, active, and strong, and averaging ... feet five inches[1] in height," a description ... fairly well to the northern fishermen, but cert... tering to the nation in general. Again, in several ... the author follows a common fashion in deplori... evils brought upon the people by European "civili... but makes no allusion to the greater evils ...

[1] Dr. Rein's estimate of the average height of the male ... This is nearly as much below the mark as Capt. St. John's ... above it.

ling, and ignores the fact that any deterioration
n has followed the recent change of circumstances
t the work of "civilisation," but of the vile or foolish
)-followers that may cling to the skirts of even the
est army.

pon the religion of the country he says little more
is to be found in a footnote at page 127; but students
be interested to learn from this that "Shinto is never
esented by any figure, but worshipped as the Unseen
it which pervades everything. Buddha, as is well
vn, is always represented by a male figure; Shinto,
unrepresented, is supposed to be a female."

riticism of the volume is to some extent disarmed by
modesty of its preface, and it no doubt contains much
will amuse the general reader.

n Dr. Rein's "Japan" we have the work not only of a
ent thoroughly versed in his subject, but of a practised
ary architect. The present volume deals with the
graphical conformation, climate, flora, and fauna of
Japanese group, and the history, ethnography, and re-
on of the people, concluding with a useful chapter on
ography. A future volume is to comprise an account
he industries and commerce, and will be welcomed by
who read the part now before us.

The geographical summary is far more complete and ac-
ate than any to which the public has yet had access, and
very page shows the hand of an expert who has brought
ginal knowledge and personal observation to bear upon
task. The climatic peculiarities are for the first time
ve by the author himself in 1876) systematically de-
ibed, and all the more important meteorological details
umulated in the past eighteen years in different parts
the country are reproduced in tabular form.

In the study of the flora and fauna the accumulation of
ts is already too large to allow the author to go far
yond the limits of enumeration. Since Dr. Rein's ac-
unt has been written a new addition has been made to
e fauna in a catalogue of the birds of Japan by Capt.
akiston and Mr. Pryer, and the number of known
ecies raised from about 250 to 325, of which about 180
cur also in China, and about 100 are represented in
reat Britain.

It is to be regretted that space could not have been
pared for a little supplementary information upon some
f those members of the animal kingdom which possess
more popular interest. For example, a few details
especting the dangerous and unpleasantly common
Mamushi (*Trigonocephalus Blomhoffii*) and the wrongly
naligned little *Hibakari* (*Tropidonotus Martensii*) would
ave been useful. The poisonous properties of certain
species of the *Fugu* or genus *Tetrodon* are pointed out,
and the symptoms produced by their use as food described;
but in the reference to the "*hungerige, blutgierige Mos-
quitos*," though feeling tribute is paid to the vexatious side
of their character, the grave charges to which they are
open are omitted, their probable agency, long recognised
by native physicians, in the conveyance of malignant pus-
tule, and the suspicion raised by Dr. Patrick Manson's
investigations in Amoy, that the spread of Elephantiasis
Arabum in the south of Japan is due to the same pest.

The second and less technical part of the book em-
braces subjects upon which the author is less able to speak *in verbâ magistri* than on geographical science. The section, "Das Japanische Volk," opens with an historical abstract of about 200 pages, compiled from Klaproth, Kæmpfer, Siebold, Satow, Aston, and other authorities. The purely mythical stories of the age of the gods are passed over rapidly, and the commencement of the history of the country is fixed at the reign of Jimmu Tenno (660 to 585 B.C.). Dr. Rein is generous enough to acknowledge without question the reputed founder of the imperial lore, of whose existence there is little more proof than of that of the *Uwabami* and *Kamaitachi*, which the Professor does not consider entitled to a place in the fauna. As is mentioned in a footnote, the earliest written records extant originated in the first part of the eighth century of our era, and admitting the possibility that these were compiled from lost manuscripts of older date, they still offer satisfactory internal evidence that the historical being of Japan is at least a thousand years younger than is indicated by the list of the ancient emperors from whom the reigning Mikado traces his descent. The fact will perhaps be sufficiently demonstrated by a citation of the ages attributed to certain of the primitive rulers. The inaugurative myth, Jimmu Tenno, is said to have lived 127 years; Koan, the sixth Mikado, 137 years; Nintoku, the seventeenth Mikado (D. 399 A.D.), 122 years; and it is not until the fifth century A.D. that the viability of the rulers appears to have become permanently limited to a reasonable degree. It is true that the birth and death of Jimmu are solemnised as national festivals, and that writers on such sober topics as the industrial arts do not hesitate to refer for their landmarks to periods long antedating the true historical period; but all allowance must be made for inherited credulity in ancient traditions, which here form part of a state religion and establish the very sanctity of the throne.

We are glad to see that Dr. Rein does not altogether reject the romantic episodes of Japanese history. Awaiting the advent of a native Walpole to bruise the simple faith of his countrymen with historic doubts, it is a grateful relief to the tedium of the long series of wars and court intrigues that form the burden of the rather monotonous recitative of the Oriental Clio, to dwell for a moment on such stories as those of the gentle wife of Yamato Dake, who cast herself into the sea to propitiate the angry gods that threatened the safety of her husband's ship; of Kesa, who sacrificed her life to preserve her wifely fidelity; and many others of the number that have lent inspiration to the pencils of Hokusai, Yosai, and a hundred lesser artists. They are probably no more apocryphal than many of the wearisome details through which the student of history must plod.

The title "Geschichte des Japanischen Volkes" adopted by the author is somewhat misplaced. The history is not that of the people but of their rulers, and it would have been well had the author given the section a better claim to the heading by interspersing the story of battle and murder by some account of the development of laws, literature, painting, the various industrial arts, and such important social ceremonies as those of the *Cha-no-yu*, which lose much of their significance when divorced from the general history of the empire.

The most valuable portion of the sketch to the foreign world is that relating to the pregnant events of the last

twenty years. In the narration of occurrences which have compelled the foreign powers, and especially Great Britain, to join issue with the Japanese Government Dr. Rein displays an absence of partisanship quite novel to those experienced in the discussion of Anglo-Japanese politics. His review of the present position and future prospects of the nation is thoughtfully cautious, and while drawing attention to the recent educational studies and the many wise acts of the present Government, shows a dark reverse to the picture in the financial difficulties now threatening serious obstruction to the path of improvement. The question of the opening of new ports or of the entire country to foreign enterprise and capital is also considered, and the writer points out the deadlock created on the one side by the great disadvantages which the Japanese foresee in admitting to competition an infinitely stronger commercial race, over whose actions they can have no judicial control, and on the other by the inexpediency, from the foreigners' point of view, of a surrender of the treaty rights while the laws and means of administration in Japan are in so unsatisfactory a condition as at the present time.

In an interesting chapter upon the Ethnography of the Japanese the author takes up the vexed problem of the origin of the now dominant race, who displaced the aboriginal Ainos. He believes, from considerations of speech, physiognomy, and traditions that they are a branch of the old Altaic family, which spread from its birthplace in all directions over the continent of Asia, some reaching Japan *vid* Tsushima, Iki, and Oki, others settling at various parts of the mainland to form the Korean, Mandschurian, and other kindred people. In this view he is supported to some extent by the physiognomical identity with the Japanese of the yet pure descendants of the Korean potters brought over as trophies of Taiko's victorious arms at the end of the sixteenth century, and established in the province of Satsuma. Mr. Aston's researches into the comparative philology of the Japanese and Korean languages (*Trans.* Royal Asiatic Society, 1879) tend to a similar conclusion, but leave the question still open.

The analyses of literature, language, and religion are necessarily incomplete, but awaiting the further progress of the labours of the scholars now engaged in the study of these special branches, Dr. Rein's summary of the present knowledge will be of great service.

The author's views as to the character of the Japanese as a race are neither romantically favourable, like those of the great majority of travellers, nor unjustly contemptuous, like the convictions cherished by nearly all settlers. The national defects Dr. Rein considers to be a greed for novelty and a lack of stability and perseverance; but although this verdict would appear to be sanctioned by recent experience, the history of the country really points to nothing less than instability. A blind admiration for antiquity and a persevering if not energetic industry has characterised nearly the whole of their older manufactures and artistic productions, and the many centuries of persistence in the path opened by their forefathers were terminated only by a sudden change of circumstances, and an entirely forced and unsought relationship with the outer world. They are now learning an entirely new exercise of their powers, and some clumsiness at the outset is inevitable, while the very impetuous progression necessarily brings their faults within the scope of a passing glance. They bought experience, and until the world sees can utilise their expensive purchase any premature. They have indeed two serious poverty of material resources, and a writ that isolates them from the European world, serious limitations upon the interchange of order of ideas amongst themselves; but generation can scarcely be blamed for ei there be a charge in the past and present are fairly open it is defect of invention, for knowledge is taken from Europe, so in former they indebted to the Asiatic continent for lite religion, and laws, as well as for a thous traits of civilisation, some of which they ha longer or better than their teachers.

Whatever dispraise is laid upon the peop writers agree to credit them with remarkable Miss Bird, however, who has studied Jap new aspect, gives a different testimony interior, and the few travellers who ha glimpse of the unbeaten tracks of the great co make strange revelations. As the better cla generally knows little or nothing of the secrets metropolitan slums, it is conceivable that living in Tokio may not be aware that *it* contai habitations than those he passes in the publ fares; but were curiosity or chance to lead him some of the little, hardly noticeable, inlets whi there break the line of the street dwellings he startled by the new world revealed to him—on hundreds of thousands of poor of the gre densely packed in filth and disease, *in* dilapid with crumbling walls and roofs that would rende the spell of Asmodeus to the Don Cleofas wh peer at the miseries only half concealed by the of sheds, moated with foul stagnant drains, reeking accumulations of sewage and garbage, from ventilating breezes by the dwellings of fortunate but less numerous citizens. *Had* he extended his pilgrimage to the *Uradana* he w written a new and curious chapter.

As regards bathing, it is certainly a common but with the poorer classes it is far less freque travellers would lead us to believe. It is more so much dictated by any unconquerable intolera dirt as by the combined attractions of warm wat neighbourly gossip. Whatever purification may rived from the common use of a limited *quantity* by several dozens of people, it is doubtful whe may not take as a set-off the odoriferous condition unwashed winter garments which often do unre duty day and night for the whole season, and the scant attention that the native feels impelled to upon his hands and face in the intervals of his the bathing-house. These remarks *however* do not that the working orders in Japan compare unfav in respect to physical purity with their European bre

impossible to do justice to Dr. Rein's important the space at our command. Its construction is tly scientific, and its thoroughness will excite the tion of all who know the difficulty of obtaining, ɔecially of selecting, information upon many of the s so exhaustively treated. The errors are few and ı important, and will probably disappear in the next .. One powerful recommendation is the absence of › from its pages; the author everywhere studiously his own individuality concealed, and in the dis- n of most points he is nearly always contented with ı statement and grouping of the principal facts as ave the inference well within the grasp of the reader's

In conclusion, it is the best of the many publi- ıs upon the subject of Japan that have appeared in ıst ten years, and, unlike most of the number, sup- a real want, and will be received gratefully by all seek for solid, trustworthy information. We trust he completion of the work will soon be issued.

OUR BOOK SHELF

les géométriques et cinématiques. Note sur quelques uestions de Géométrie et de Cinématique, et Réponse x Réclamations de M. l'Abbé Aoust. Par E. J. Habich. pp. (Lima, 1880.)

L'ABBÉ AOUST, author of the "Analyse infinitésimale Courbes planes," and our author put forward con- ng claims as to priority of discovery.

he polemics have fired off their powder in *Les Mondes* ıe iv., 1880, Aoust: tome l., 1879, Habich; see also *Comptes rendus*, lxxxv., 1877, and lxxxix., 1879), and object of the present pamphlet is "de réduire à leur e valeur les assertions" of the Abbé. The matters in ɔute can be inferred from the three divisions of the ɜent work:—

1. Développoïdes—considérations historiques, étude enveloppes des droites par la considération du centre :antané de rotation, développoïdes des divers ordres levellopoïdes inverses.

'2. Coordonnées tangentielles-polaires.

'3. Mouvement géométrique d'une figure plane dans ı plan—considérations générales, mouvement géo- :trique déterminé par deux systèmes d'enveloppées et :nveloppes, mouvement d'une droit sur un plan."

We have, of course, but one side of the quarrel pre- nted to us, but leaving polemics on one side there is a eat deal of interesting matter put before us. Time will, ı doubt, settle the question of priority.

Synopsis of Elementary Results in Pure and Applied Mathematics. By G. S. Carr, B.A. Vol. i. part viii. (C. F. Hodgson and Son, 1880.)

VE recently noticed with approval the volume con- ıining the first seven parts. This eighth part carries on ıe articles from 1400 to 1868, and is concerned with the ifferential calculus. It contains an abstract of the usual rocesses, and besides gives a succinct account of the heory of operations, and an analysis of matters which .re treated of in the higher algebra, as Jacobians and ıuantics, and closes with maxima and minima, the ɜeometrical applications being reserved for the parts on Co-ordinate Geometry.

These fifty-six pages are very correctly printed, at least we have not detected more than three or four trivial typographical errors.

This part maintains the handy character for reference of its forerunners.

The Practical Fisherman. By T. H. Keene. (London: *The Bazaar* Office.)

THIS book deals with the natural history, the legendary lore, and the capture of British freshwater fish, together with the art of tackle-making. The author has bestowed great care on his work, and seems to have studied every book written or published on the charming subject from Oppian to the present time. Mr. Keene is besides an enthusiastic fisherman, and has thus produced a treatise of great interest to the practical angler. We may add that this work is almost the only one on angling which treats of the natural as well as the traditional history of fishes.

LETTERS TO THE EDITOR

[*The Editor does not hold himself responsible for opinions expressed by his correspondents. Neither can he undertake to return, or to correspond with the writers of, rejected manuscripts. No notice is taken of anonymous communications.*

[*The Editor urgently requests correspondents to keep their letters as short as possible. The pressure on his space is so great that it is impossible otherwise to ensure the appearance even of communications containing interesting and novel facts.*]

The Movements of Leaves

FRITZ MUELLER has sent me some additional observations on the movements of leaves, when exposed to a bright light. Such movements seem to be as well developed and as diversified under the bright sun of Brazil, as are the well-known sleep or nyctitropic movements of plants in all parts of the world. This result has interested me much, as I long doubted whether paraheliotropic movements were common enough to deserve to be separately designated. It is a remarkable fact that in certain species these movements closely resemble the sleep movements of allied forms. Thus the leaflets of one of the Brazilian Cassiæ assume when exposed to sunshine nearly the same position as those of the not distantly allied Hæmatoxylon when asleep, as shown in Fig. 153 of "The Movements of Plants." Whereas the leaflets of this Cassia sleep by moving down and rotating on their axes, in the same peculiar manner as in so many other species of the genus. Again, with an unnamed species of Phyllanthus, the leaves move forwards at night, so that their midribs then stand nearly parallel to the horizontal branches from which they spring; but when they are exposed to bright sunshine they rise up vertically, and their upper surfaces come into contact, as they are opposite. Now this is the position which the leaves of another species, namely *Phyllanthus compressus*, assume when they go to sleep at night. Fritz Müller states that the paraheliotropic movements of the leaves of a Mucuna, a large twining Papilionaceous plant, are strange and inexplicable; the leaflets sleep by hanging vertically down, but under bright sunshine the petiole rises vertically up, and the terminal leaflet rotates by means of its pulvinus through an angle of 180°, and thus its upper surface comes to stand on the same side with the lower surfaces of the lateral leaflets. Fritz Müller adds, "I do not understand the meaning of this rotation of the terminal leaflet, as even without such a movement it would be apparently equally well protected against the rays of the sun. The leaflets, also, on many of the leaves on the same plant assume various other strange positions." With one species of Desmodium, presently to be mentioned as sleeping in a remarkable manner, the leaflets rise up vertically when exposed to bright sunshine, and the upper surfaces of the lateral leaflets are thus brought into contact. The leaves of *Bauhinia grandiflora* go to sleep at an unusually early hour in the evening, and in the manner described at p. 373 of "The Movements of Plants," namely, by the two halves of the same leaf rising up and coming into close contact: now the leaves of *Bauhinia Brasiliensis* do not sleep, as far as Fritz Müller has seen, but they are very sensitive to a bright light, and when thus exposed the two halves rise up and stand at 45° or upwards above the horizon.

Fritz Müller has sent me some cases, in addition to those given in my former letter of March 3, of the leaves of closely-allied plants which assume a vertical position at night by widely different movements; and these cases are of interest as indicating that sleep-movements have been acquired for a special purpose. We have just seen that of two species of Bauhinia the leaves of one sleep conspicuously, while those of a second species appa-

rently do not sleep at all. The leaves of *Euphorbia jacquiniæflora* depend vertically at night, whereas those of a dwarfish Brazilian species rise vertically up at night. The leaves of this Euphorbia stand opposite one another—a position which is rather rare in the genus; and the rising movement may be of service to the plant, as the upper surfaces of the opposite leaves mutually protect one another by coming into contact. In the genus Sida the leaves of two species rise, while those of a third Brazilian species sink vertically down at night. Two species of Desmodium are common plants near Fritz Muller's house: in one the leaflets move simply downwards at night; but in the other not only do the three leaflets move vertically down, while the main petiole rises vertically up, as is likewise the case with *D. gyrans*, but in addition the lateral leaflets rotate so as to stand parallel with the terminal leaflet, behind which they are more or less completely hidden. This, as far as I have seen, is a new kind of nyctitropic movement; but it leads to a result common to several species, namely, that of packing the three leaflets closely together and placing them in a vertical position.

Down, Beckenham, Kent, April 14 CHARLES DARWIN

Spectrum of the Star Ll. 13412

THE spectrum of the star Ll. 13412 appears to be in some respects unique. It consists mainly of three bright lines having wave-lengths of 545, 486, and 466 millionths of a millimetre. Four other stars have hitherto been found whose spectra are of this character. Three of them are in Cygnus, and have lines whose wave-lengths are 580, 568, 536, and 467. The fourth star, Oeltzen 17681, has lines at about 582 and 470 (NATURE, vol. xxii. p. 483). The line or band at 467 appears to be common to all, and that at 580 to the last four. The line at 486 in Ll. 13412 coincides with the F line of hydrogen, but is not visible in the other stars. The line at 545 is also absent in them. This star therefore appears to resemble the others in kind, but not in the material of which it is composed. It is also much brighter than the others, so that it is not a difficult object with a small telescope. Its position for 1880 is in R.A. 6h. 49·3m. and Dec. −23° 47′. It is easily found as a seventh magnitude star about 15′ north of *o Canis Majoris*.

Cambridge, U.S., April 14 EDWARD C. PICKERING

The Indian Winter Rains

IN NATURE, vol. xxiii. p. 400, Mr. F. Chambers very properly points out that the winter rains of Northern India, though usually heaviest in years when the *mean* pressure is above the average, are yet coincident with short periods of low rather than of high pressure. The way in which Mr. Chambers accounts for the low pressure seems, however, rather far-fetched. It is true that on one or two of the American weather charts storm tracks are shown extending from the Mediterranean to Northern India or the Bay of Bengal, but these paths are drawn with dotted lines indicating that they are doubtful, and, considering the absence of meteorological stations in the greater part of the area between the Mediterranean and India, and the nature of the intervening country—especially Afghanistan with its high mountains—I should say the evidence up in the strength of which the American chartographer laid down these storm tracks, was of the slightest possible description. The winter rains are however accompanied by a cyclonic movement of the air over Northern India, and I wish to point out that, whether the cyclonic disturbance be a European or Trans-atlantic visitor, as Mr. Chambers supposes, or a native of the Indian region, generated by the rainfall, as Mr. Eliot has taught in his report for 1877, the "old notion" of the connection of the rains with the upper anti-monsoon current is by no means exploded. The progress of the disturbance and of the rainfall is usually from north-west to south-east, and the rainfall is heaviest, as a rule, on the eastern side of the disturbance. The winds which bring the rainfall therefore come from some southerly quarter, and as northerly winds generally continue blowing in the extreme south of India at the time when these disturbances occur in the north, the southerly rainy winds must be derived from an upper current which descends in the anti-cyclone or region of high pressure in the centre and south of India, or in the zone between the south of India and the equator. Mr. Blanford's modification of his former views regarding the origin of these rains appears from his remarks and the accompanying charts in the Meteorological Report for 1878 to be merely that the indraught towards the region of precipitation is not confined to N occasionally, though rarely, felt as far sou

In a letter of mine that appeared in NA week (p. 409), there was a mistaken inf ford's investigation regarding the "Barome India and West Siberia that I beg your The mean pressure at sea-level in the Ind Siberian regions appears from Mr. Bucha the same both on the average of the year a Also no wind blows directly from the one re cannot therefore infer anything regarding th from Mr. Blanford's results, but we may The proper inferences of this kind from the r Blanford and Mr. Archibald appear to be of temperature in the 11-year period is grea surrounding countries; (2) Siberia is col neighbouring countries, at times of maxima relation is most marked in winter; and (the Pacific (Nertchinsk, Pekin, Zi-ka-wei), Indo-Malayan stations, especially those nea Atlantic (London) oceans, where presumab perature is less than in the heart of the co of the barometer in the 11-year period is opp in Siberia.

Allahabad, March 29

Palæolithic Man

IT is desirable that further search should ments made by man in the deposits of this be older than the well-known and accepte river-gravels.

In the gravels belonging to the Thames, i palæolithic implements are of not infreque my own collection I have more than 120 e exceptions found by myself—and I know hundred specimens found chiefly by Londo availed themselves of hints given by me.

My object now is to direct attention to the ments are not only found in and near Londo middle terraces of gravel some 25 to 70 feet a datum, but at far greater heights. Some of London may, and others no doubt do, belong to tributaries, but they all (in different degrees) more remote time than the period when the lo Thames and its tributaries were formed. So ments now found in the lower gravels are from more ancient deposits. For instance, I white in colour and highly porcellaneous;—the been brought about by the decomposition of ancient loam or clay, and not from the gravel plement was found; this is proved by seve highly-polished accidental fractures at the ed colour from the general white surface: these e are more recent than the white facets, and da deposition of the implement in the lower te abraded flakings belong to a highly remote time records the finding of an implement in the T Highbury, at 102 feet, whilst I have found Highbury), at an elevation of 144 feet. Last an implement on the eminence at the north of, Ealing Dean, at a height of 164 feet. This is than the implementiferous beds of Ealing Dea General Pitt Rivers, and between 80 and 100 fee instance 104 feet higher) than the implement-be Acton described by the same gentleman. The gr feet elevation forms an isolated patch on the ex hill. I watched the excavations here (which we road-making, with great care, and with the imp several flakes. These heights agree well with the of the implementiferous gravels found capping t South of England, also with the Erith position a land Heath, where Mr. F. C. J. Spurrell found a an elevation of 175 feet.

Most geologists know the high gravels overlook Ware, and Amwell; their altitude is from 130 to above the ordnance datum. Gravel from the two places is brought to London for ballast in thous A year or two ago great quantities of gravel f were brought to Finsbury Park by the Great N way, and in the gravel thrown down near Finsb

up a good sub-triangular wedge-shaped implement. search produced a second implement, a good trimmed nd a few simple flakes. The worked flints in the Hert- avel are however so rare that the search for them is the opeless task conceivable. There is not more than one 500 tons, not one implement in 5000 tons of gravel. avel from Ware is also brought to the east of London for and I happened last year to mention the fact of my dis- s to Mr. J. E. Greenhill, the Principal of a school near ey Downs. Mr. Greenhill at once not only searched him- it set his pupils to look over the Ware gravel, then laid in large quantities near Clapton, with the result that a roken ovate implement was found and several flakes. I also a large and heavy "slice" flake with numerous facets on its l side in the same gravel. Mr. Greenhill's success caused me carefully over a similar lot of gravel from Ware, laid down ictoria Park. In this I found a sub-triangular implement iree flakes. I have also found a large greatly abraded n the Amwell gravel at Amwell. Elsewhere in east and east London I have looked over thousands of tons of Hert- nd Ware gravel without decisive result. A week or two owever, as my younger son was returning home through ury Park, he picked up a good scraper-like implement in the (presumably from Hertford), just thrown on to the road the park. On hearing of the discovery I at once went to ury Park and looked carefully over all the recently thrown material, but with no further result. I have visited the nt pits at Hertford, Ware, and Amwell several times, but is never enough gravel exposed (considering the extreme arative rarity of the implements and flakes) to give one a e of finding an implement. I have found in the pits l simple flakes, with the cone of percussion, and that is At what depth the implements occur in the gravel I do not , but that implements really do come out of the high ls overlooking Hertford and Ware I think there can o doubt. Reference was made by me to these imple- s at the Anthropological Institute three years ago, when r three specimens were exhibited by me.

Sound of the Aurora

ITH every respect for the ability and acuteness of the late ohn Franklin and his companions, I do not think it con- ve, as Mr. Rouse seems to do, that because they heard no ds "with the aurora borealis" (NATURE, vol. xxiii. p. 556), ounds are produced by it.

ll Indians, both on the shores of Hudson's Bay and near Lake, and the Eskimos on many parts of the coast, assert tively that the bright, varying, flickering,[1] and rapidly- ing auroræ do produce sound. The senses of hearing and lling in the Indian and Eskimo are far more acute than in civilised man; and both sounds and smells which to the er are not perceptible are perfectly so to the more sensitive itory and olfactory organs of the savage.

he theory that "the attractive force of the aurora is increased ain a certain limit as its rays proceed southward" is scarcely ne out by my experience.

When wintering at Fort Hope, Repulse Bay, in 1846-47 and 3-54, lat. 66° 32′ N., the result of my observations was, as as I can discover, exactly similar to that of Parry in 1824-25 Port Bowen in lat. 73° 15′ N., 400 miles further north and fifty es west of Fort Hope: at both no effect was produced on the gnetic needle.

At Repulse Bay, and it may have been the same at Port wen, the character of the aurora was perfectly different from t generally seen at Great Bear Lake, which acted so power- ly on the needle, the former being almost always of a uniform le yellow or straw colour, with little rapid motion, whereas the ter was generally flashing, flickering, rapidly moving, and of rerse hues.

One peculiarity of the auroræ observed at Repulse Bay may worthy of notice: they were chiefly seen to the magnetic uth—that is south 62° east true—usually in the form of an arch ther low down—and I may add that in that direction at a stance of thirty or forty miles from our head-quarters a large tent of sea is kept open all winter by strong currents. The Eskimos of Repulse Bay do not say much about the aurora beyond expressing a belief that it is the spirits of their dead visiting each other in the heavens.

It is probably a matter of little or no importance in a question of this kind, but Mr. Rouse has given the latitudes of the southern shores of Great Bear Lake from 90 to 200 miles too far north.

Fort Franklin, where Franklin made his chief observations, is situated in latitude 65° 12′ N. at the extreme south-west of Great Bear Lake, whereas Fort Confidence, where Sir J. Richardson and I made ours with like results, is at the extreme north-east of the lake in lat. 66° 54′ N., the stations being 150 miles distant from each other.

It is perhaps not being too sanguine to hope that in this period of marvellous discoveries, some instrument may be—if not already—invented, with the aid of which one may be able to decide the question satisfactorily as to whether the aurora in any form does or does not produce sound.

THE SCIENTIFIC PRINCIPLES INVOLVED IN ELECTRIC LIGHTING[1]

II.

Lectures III. and IV.

ALL machines for the conversion of mechanical work into electricity are founded on Faraday's great discovery of the induced current derived from the relative motion of a magnet and a coil of wire. They are either continuous-current or alternate-current machines. From the continuous-current machines of Pixii in 1832 and Saxton and Clarke in 1835 and 1836, we pass to Wheatstone's introduction in 1845 of electromagnets in place of permanent magnets to produce the magnetic field. In 1854 Werner Siemens and Halske introduced the Siemens armature, in which the coil is wound longitudinally in a groove. In 1854 Hjorth patented an improved magneto-electric battery, in which the currents induced in the revolving armature pass round the electromagnets and produce the magnetic field. This is the principle of the dynamo-electric machine, which was afterwards rediscovered by Siemens and by Wheatstone simultaneously in 1867, when on the same evening their two papers were presented to the Royal Society.

Then followed the Gramme armature, in which coils of wire are wound in sections all in the same direction round a ring; each section, when a current is flowing through it, may be regarded as an electro-magnet, and its principle of action is clear at once from the principles of Arago and from Lenz's laws for induced currents.

In dynamo-electric machines the external work in the electric arc is proportional to the square of the current, and is also proportional to the number of turns of the armature per minute.

Any disturbance in the resistance of the arc reacts on the electro-magnet, altering the strength of the magnetic field, thereby increasing the disturbance; this is the great disadvantage of dynamo-electric machines as compared with magneto-electric machines, where the magnet is either a permanent magnet or is excited by means of a separate current. Wilde, in 1863, employed a separate continuous current machine to give a permanent magnetic field, and made the armature of the second machine to revolve in this magnetic field. In alternate-current machines there is no commutator for making the current continuous, but the currents from the coil are collected and sent through the external resistance in opposite directions for every half-turn of the armature. The Alliance magneto-electric machine was the first of these, which was converted by Holmes into a continuous-current machine, and was by him first used in 1858 to produce the electric light for lighthouse illumination. He afterwards again converted his machine into an alternate-

[1] By Prof. W. Grylls Adams, F.R.S. Continued from p. 582.

current machine by removing the commutator, thereby producing a very effective machine.

All theoretical determinations of the efficiency of machines are complicated by the retardation of magnetisation of the magnets, which necessitates a change of position of the commutator or brushes in the direction of the rotation of the armature. The practical determinations of efficiency which have been made show that from 86 to 88 per cent. of the energy communicated to a dynamo-machine is converted into electrical energy, and that from 44 to about 50 per cent. of the total work may be converted into useful work in the external circuit. Among the more recent continuous current machines are the Brush and the Bürgin machines, which promise to give good results.

At intervals during the lecture the room was lighted by various electric lamps, the peculiarities of each of which were explained. The Brockie lamp, lent by the British Electric Light Company, and served by one of their Gramme machines; the Siemens pendulum-lamp lent by Dr. Siemens, and the Crompton lamp lent by Mr. Crompton, were each tried in turn, and attention was drawn to the Siemens' differential lamp, the Brush lamp, and other lamps and electric candles which were also exhibited.

The subject of the fourth Cantor lecture was the subdivision of the electric current and lighting by incandescence. Prof. Adams showed that objections raised to the electric light were similar to those which had been urged with regard to gas when it was first introduced. He then compared the energy of Grove's cells with the energy derived from a small Gramme machine, and showed how impracticable it was to attempt to do by means of batteries the work which can be done by such machines. He then explained how the same amount of energy might be spent in two classes of machines, those of low internal resistance and low electromotive force which send a strong current through small external resistance, or tension-machines. quantity machines, and those of high internal resistance and high electromotive force sending a smaller current through large external resistance, or tension-machines. For very high resistances the discharge of an induction-coil is taken, the action of which was compared to the action of the hydraulic ram. Prof. Adams proceeded to describe the Werdermann and the Joel lamps, and explained the kind of machine specially suited for such lamps, and regretted that it would not be possible to show them to the best advantage, or to give them a fair trial, because the machine actually in use at the speed at which it was running was not adapted for them. An electromotive force of 130 volts will send 50 webers through 10 lamps in series, and give an illumination of 320 candles in each lamp for an expenditure about 10 h.p. Taking Mr. A. Siemens' facts as to the cost, it appears that the electric light from the Joel lamp would be as cheap as gas at the rate of 2s. per 1000 cubic feet. The laws of the subdivision of the electric current were discussed, and their application to the system of incandescent lighting adopted by Swan, and by Lane-Fox and Edison was clearly shown. With the Bürgin machine, then in use, giving at 1620 revolutions a minute an electromotive force of 160 volts, and a current of 24 webers through an external resistance of about 7 ohms, it was shown that 24 rows of two Swan lamps in series or 48 lamps could be lit up: each lamp being of 80 ohms resistance, and giving a 48 candle-power light. If the resistance of each lamp be 40 instead of 80 ohms, then double the number of lamps might be taken in series, giving about 100 lamps from the machine.

With the Brush machine at least 140 lamps might be lit up in 10 parallel rows of 14 lamps in series. The early attempts of King, and Staite, and Konn to light by incandescence were then explained, and experiments made to illustrate the phenomena seen in high vacua, such as are necessary to enable Mr. Fox to preserve their carbons from dered incandescent by means of the

And all kinds of real knowledge he facts of nature do so bear upon one out in strange ways practically helpful, pour out my scientific budget, in the ing more may come of it than the grati- gent curiosity.

its to exemplify the meaning of the word

[1] By Prof. Huxley at the National Fishery Exhibition.

"fish" he cannot choose a better animal than a herring. The body, tapering to each end, is covered with thin, flexible scales, which are very easily rubbed off. The taper head, with its underhung jaw, is smooth and scaleless on the top; the large eye is partly covered by two folds of transparent skin, like eyelids—only immovable and with the slit between them vertical instead of horizontal; the cleft behind the gill cover is very wide, and, when the cover is raised, the large red gills which lie beneath it are freely exposed. The rounded back bears the single moderately long dorsal fin about its middle. The tail fin is deeply cleft, and on careful inspection small scales are seen to be continued from the body, on to both its upper and its lower lobes, but there is no longitudinal scaly fold on either of these. The belly comes to an edge, covered by a series of sharply-keeled bony shields between the throat and the vent; and behind the last is the anal fin, which is of the same length as the dorsal fin. There is a pair of fore-limbs, or pectoral fins, just behind the head; and a pair of hind-limbs, or ventral fins, are situated beneath the dorsal fin, a little behind a vertical line drawn from its front edge, and a long way in front of the vent. These fins have bony supports or rays, all of which are soft and jointed.

Like most fishes, the herring is propelled chiefly by the sculling action of the tail-fin, the rest serving chiefly to preserve the balance of the body, and to keep it from turning over, as it would do if left to itself, the back being the heaviest part of the fish.

The mouth of the herring is not very large, the gape extending back only to beneath the middle of the eye, and the teeth on the upper and lower jaws are so small as to be hardly visible. Moreover, when a live herring opens its mouth, or when the lower jaw of a dead herring is depressed artificially, the upper jaw, instead of remaining fixed and stationary, travels downwards and forwards in such a manner as to guard the sides of the gape. This movement is the result of a curious mechanical arrangement by which the lower jaw pulls upon the upper, and I suspect that it is useful in guarding the sides of the gape when the fish gulps the small living prey upon which it feeds.

The only conspicuous teeth, and they are very small, are disposed in an elongated patch upon the tongue, and in another such patch, opposite to these, on the fore part of the roof of the mouth. The latter are attached to a bone called the vomer, and are hence termed vomerine teeth. But, if the mouth of a herring is opened widely, there will be seen, on each side, a great number of fine, long, bristle-like processes, the pointed ends of which project forwards. These are what are termed the gill rakers, inasmuch as they are fixed, like the teeth of a rake, to the inner sides of those arches of bone on the outer sides of which the gills are fixed. The sides of the throat of a herring, in fact, are as it were cut by four deep and wide clefts which are separated by these gill arches, and the water which the fish constantly gulps in by the mouth flows through these clefts, over the gills and out beneath the gill covers, aerating the blood, and thus effecting respiration, as it goes. But since it would be highly inconvenient, and indeed injurious, were the food to slip out in the same way, these gill rakers play the part of a fine sieve, which lets the water strain off, while it keeps the food in. The gill rakers of the front arches are much longer than those of the hinder arches, and as each is stiffened by a thread of bone developed in its interior, while, at the same time, its sides are beset with fine sharp teeth, like thorns on a brier, I suspect that they play some part in crushing the life out of the small animals on which the herrings prey.

Between these arches there is, in the middle line, an opening which leads into the gullet. This passes back into a curious conical sac which is commonly termed the stomach, but which has more the character of a crop.

Coming off from the under side of the sac and communicating with it by a narrow opening, there is an elongated tubular organ, the walls of which are so thick and muscular that it might almost be compared to a gizzard. It is directed forwards, and opens by a narrow prominent aperture into the intestine, which runs straight back to the vent. Attached to the commencement of the intestine, there is a score or more of larger and shorter tubular organs which are called the pyloric cæca. These open into the intestine, and their apertures may be seen on one side of it, occupying an oval space, in the middle of which they are arranged three in a row.

The chief food of the herring consists of minute Crustacea, some of them allied to the shrimps and prawns, but the majority belonging to the same division as the common *Cyclops* of our fresh waters. These tenant many parts of the ocean in such prodigious masses that the water is discoloured by them for miles together, and every sweep of a fine net brings up its tens of thousands.

Everybody must have noticed the silvery air-bladder of the herring, which lies immediately under the backbone, and stretches from close to the head to very near the vent, being wide in the middle and tapering off to each end. In its natural state, it is distended with air; and, if it is pricked, the elastic wall shrinks and drives the air out, as if it were an indiarubber ball. When the connexions of this air-bladder are fully explored it turns out to be one of the most curious parts of the organisation of the whole animal.

In the first place, the pointed end of the sac or crop into which the gullet is continued runs back into a very slender duct which turns upwards and eventually opens into the middle of the air-bladder. The canal of this duct is so very small and irregularly twisted, that, even if the air-bladder is squeezed, the air does not escape into the sac. But, if air is forced into the sac by means of a blowpipe, the air passes without much difficulty the other way, and the air-bladder becomes fully distended. When the pressure is removed, however, the air-bladder diminishes in size to a certain extent, showing that the air escapes somewhere. And if the blowing up of the air-bladder is performed while the fish is under water, a fine stream of air-bubbles may be seen to escape close to the vent. Careful anatomical investigation, in fact, shows that the air-bladder does not really end at the point where its silvery coat finishes, but that a delicate tube is continued thence to the left side of the vent, and there ends by an opening of its own.

Now the air-bladder of all fishes is, to begin with, an outgrowth from the front part of the alimentary canal, and there are a great many fishes in which, as in the herring, it remains throughout life in permanent communication with the gullet. But it is rare to find the duct so far back as in the herring; and, at present, I am not aware that the air-bladder opens externally in any fishes except the herring and a few of its allies.

There is a general agreement among fishermen that herrings sometimes make a squeaking noise when they are freshly taken out of the water. I have never heard this sound myself, but there is so much concurrent testimony to the fact that I do not doubt it; and it occurs to me that it may be produced when the herrings are quickly brought up from some depth by means of this arrangement. For under these circumstances the air, which the air-bladder contains, expands to such a degree, on being relieved from the pressure of the water, that deep-sea fishes with a closed air-bladder which are brought to the surface rapidly are sometimes fairly turned inside out by the immense distension, or even bursting, of the air-bladder. If the same thing should happen to the herring the like misfortune would not befall it, for the air would be forced out of the opening in question, and might readily enough produce the squeak which is reported. The common Loach[1] is said to produce a pip air which this fish takes into it purposes.

At the opposite end of the ai more curious arrangement. T bladder ends in front just behin bladder itself does not termin canals, each of which is not m of an inch in diameter, thoug relatively thick wall of cartilage, side, from the air-bladder to the canals enter the walls of the sk into two branches. Finally, each a bag which lies in a spheroidal c size and form; and, in consequen contain, these bags may be seen through the side walls of the sku a peculiar structure where it these two bags, which constitute air-bladder on each side, are in organ of hearing. Indeed, a pro jects into the front chamber on ea by only a very delicate partition f the air-bladder. Any vibrations or any change in the pressure of thus tell upon the hearing apparat

There is no doubt about the ex tures which, together with the poste bladder, were most accurately des years ago, by the eminent anato afraid we are not much wiser re than we were when they were first in general, there can be little doub the air-bladder is to diminish the fish and, by rendering its body of as so much water, to render the easier. In those fishes in which the cation between the air-bladder and closed, the air is no doubt secreted by its vessels, which are often ver herring, the vessels of the air-bladde it seems probable that the air is s into the air-bladder just as the loa drives it into its intestine. And, suggested, it may be that the nar which leads from the air-bladder to of safety-valve allowing the air to es rapidly ascending or descending, a the water upon the contained air.

This hypothesis may be put forwar probability, but I really find it diffic thing with respect to the physiologi connection between the air-bladder a theless such an elaborate apparatus physiological importance; and, this co ened by the well-known fact that there fishes in which the air-bladder and th nected in one way or another. In example, the front end of the air-bladde series of little bones with the organ of as it were, prolonged backwards to me the hinder end of the skull. But her which is very large, may act as a re the herring, the extreme narrowness of t connect the air-bladder with the ear re suppose that the organ can have any su

In addition to the singular connectio the exterior by the roundabout way o there are membranous spaces in the w by which vibrations can more directly re ear. And there is no doubt that the fish

[1] See Müller, "Ueber Fische welche Töne von sic *Physiologie*, 1837, p. 267. The herring is not mentio vocal fishes.

a vibrations. In a dark night, when the water is horescent or, as the fishermen say, there is plenty erefire," it is a curious spectacle to watch the effect irply tapping the side of the boat as it passes over il. The herrings scatter in all directions, leaving s of light behind them, like shooting stars.

herring, like other fishes, breathes by means of the the essential part of which consists of the delicate, vascular filaments, which are set in a double row outer faces of each of the gill arches. The venous which returns from all parts of the body to be ted in the heart, is pumped thence into the gills, there exchanges its excess of carbonic acid gas e gaseous oxygen which is dissolved in sea-water. freedom of passage of the water, and the great size lelicacy of the gills, facilitate respiration when the s in its native element; but the same peculiarities itting of the rapid drying and coherence of the gills, hus bringing on speedy suffocation, render its tenure e, after removal from the water, as short as that of any

It may be observed, in passing, that the wide clefts id the gill-covers of the herring have some practical rtance, as the fish, thrusting its head through the ies of the drift-net, is caught behind them and cannot cate itself. In the herring, the upper end of the last left is not developed into a sac or pouch, such as we find in some of its near neighbours.

ne only other organs of the herring, which need be tioned at present, are the milt and roe, found in the and female herring respectively.

hese are elongated organs attached beneath the air- der, which lie, one on each side of the abdominal ty, and open behind the vent by an aperture common ne two. The spermatic fluid of the male is developed ie milt and the eggs of the female in the roe. These s, when fully formed, measure from one-sixteenth to twenty-fifth of an inch in diameter; and, as, in the female, the two roes or ovaries stretch from one end he abdominal cavity to the other, occupying all the ce left by the other organs, and distending the cavity, number of eggs which they contain must be very st. Probably 10,000 is an under-estimate of the nber of ripe eggs shed in spawning by a moderate-sized ale herring. But I think it is safer than the 30,000 of ie estimates, which appear to me to be made in forget- iess of the very simple anatomical considerations that roe consists of an extensive vascular framework as l as of eggs; and, moreover, that a vast number of eggs which it contains remain immature, and are not d at the time of spawning.

In this brief account of the structure of the herring I ve touched only on those points which are peculiarly eresting, or which bear upon what I shall have to say and by. An exhaustive study of the fish from this int of view alone would require a whole course of tures to itself.

The herring is a member of a very large group of fishes read over all parts of the world, and termed that of the *upeida*, after *Clupea*, the generic name of the herring elf. Our herring, the *Clupea harengus*, inhabits the White a and perhaps some parts of the Arctic Ocean, the tem- rate and colder parts of the Atlantic, the North Sea, d the Baltic, and there is a very similar, if not identi- l, species in the North Pacific. But it is not known to cur in the seas of southern Europe, nor in any part of e intertropical ocean, nor in the southern hemisphere.

There are four British fishes which so closely resemble errings, externally and internally, that, though prac- cal men may not be in any danger of confounding iem, scientific zoologists have not always succeeded in efining their differences. These are the Sprat, the Allice nd Twaite Shads, and the Pilchard.

The sprat comes nearest; indeed young herrings and prats have often been confounded together, and doubts have been thrown on the specific distinctness of the two. Yet if a sprat and a young herring of the same size are placed side by side, even their external differences leave no doubt of their distinctness. The sprat's lower jaw is shorter; the shields in the middle of the belly have a sharper keel, whence the ventral edge is more like a saw; and the ventral fin lies vertically under the front edge of the dorsal fin, or even in front of it; while in the herring, though the position of the ventral fin varies a little, it lies more or less behind the front margin of the dorsal fin. The anal fin is of the same length as the dorsal, in the herring, longer than the dorsal in the sprat. But the best marks of distinction are the absence of vomerine teeth in the sprat, and the smaller number of pyloric cæca, which do not exceed nine, their openings being disposed in a single longitudinal series.

Shads and pilchards have a common character by which they are very easily distinguished from both sprat and herring. There is a horizontal fold of scaly skin on each side of the tail above and below the middle line. Moreover they have no teeth in the inside of the mouth, and their pyloric cæca are very numerous—a hundred or more—their openings being disposed five or six in a row.

The shads have a deep narrow notch in the middle line of the upper jaw, which is absent in the pilchard. The intestine of the shad is short and straight, like that of the herring; while that of the pilchard is long and folded several times upon itself.

Both of these fishes, again, possess a very curious structure, termed an accessory branchial organ, which is found more highly developed in other fishes of the herring family, and attains its greatest development in a fresh-water fish, the *Heterotis*, which inhabits the Nile. This organ is very rudimentary in the shad (in which it was discovered by Gegenbaur [1]), but it is much larger in the pilchard, in which, so far as I know, it has not heretofore been noticed. In *Chanos* and several other Clupeoid fishes it becomes coiled upon itself, and in *Heterotis* the coiled organ makes many turns. The organ is commonly supposed to be respiratory in function; but this is very doubtful.

Herrings which have attained maturity and are distended by the greatly enlarged milt or roe are ready to shed the contents of these organs or, as it is said to spawn. In 1862, we found a great diversity of opinion prevailed as to the time at which this operation takes place, and we took a great deal of trouble to settle the question, with the result which is thus stated in our Report:—

"We have obtained a very large body of valuable evidence on this subject, derived partly from the examination of fishermen and of others conversant with the herring fishery; partly from the inspection of the accurate records kept by the fishery officers at different stations, and partly from other sources; and our clear conclusion from all this evidence is, that the herring spawns at two seasons of the year, in the spring and in the autumn. We have hitherto met with no case of full or spawning herrings being found, in any locality, during what may be termed the solstitial months, namely June and December; and it would appear that such herrings are never (or very rarely) taken in May or the early part of July, in the latter part of November, or the early part of January. But a spring spawning certainly occurs in the latter part of January, in February, in March, and in April; and an autumn spawning in the latter part of July, in August, September, October, and even as late as November. Taking all parts of the British coast together, February and March are the great months for the spring spawning, and August and September for the autumn spawning. It is not at all likely that the same fish spawn twice in the year; on the contrary, the spring and the autumn shoals are probably perfectly distinct; and if the herring, according to the hypothesis advanced above, come to maturity

[1] "Ueber das Kopfskelet von *Alepocephalus rostratus*," *Morphologisches Jahrbuch*, Bd. iv., Suppl. 1878.

in a year, the shoals of each spawning season would be the fry of the twelvemonth before. However, no direct evidence can be adduced in favour of this supposition, and it would be extremely difficult to obtain such evidence."[1]

I believe that these conclusions, confirmatory of those of previous careful observers[2] are fully supported by all the evidence which has been collected, and the fact that this species of fish has two spawning seasons, one in the hottest and one in the coldest months of the year, is very curious.

Another singular circumstance connected with the spawning of the herring is the great variety of the conditions, apart from temperature, to which the fish adapts itself in performing this function. On our own coasts, herrings spawn in water of from ten to twenty fathoms, and even at greater depths, and in a sea of full oceanic saltness. Nevertheless herrings spawn just as freely, not only in the narrows of the Baltic, such as the Great Belt, in which the water is not half as salt as it is in the North Sea and in the Atlantic, but even in such long inlets as the Schlei in Schleswig, the water of which is quite drinkable and is inhabited by freshwater fish. Here the herrings deposit their eggs in two or three feet of water; and they are found, along with the eggs of freshwater fish, sticking in abundance to such freshwater plants as *Potamogeton*.

Nature seems thus to offer us a hint as to the way in which a fish like the shad, which is so closely allied to the herring, has acquired the habit of ascending rivers to deposit its eggs in purely fresh water.

If a full female herring is gently squeezed over a vessel of sea-water, the eggs will rapidly pour out and sink to the bottom, to which they immediately adhere with so much tenacity that, in half an hour, the vessel may be inverted without their dropping out. When spawning takes places naturally the eggs fall to the bottom and attach themselves in a similar fashion. But, at this time, the assembled fish dart wildly about, and the water becomes cloudy with the shed fluid of the milt. The eggs thus become fecundated as they fall, and the development of the young within the ova sticking to the bottom commences at once.

The first definite and conclusive evidence as to the manner in which herring spawn is attached and becomes developed that I know of, was obtained by Prof. Allman and Dr. MacBain in 1862,[3] in the Firth of Forth. By dredging in localities in which spent herring were observed on the 1st of March, Professor Allman brought up spawn in abundance at a depth of fourteen to twenty-one fathoms. It was deposited on the surface of the stones, shingle, and gravel, and on old shells and coarse shell-sand, and even on the shells of small living crabs and other crustacea, adhering tenaciously to whatever it had fallen on. No spawn was found in any other part of the Forth; but it continued to be abundant on both the east and the west sides of the Isle of May up to the 13th of March, at which time the incubation of the ovum was found to be completed in a great portion of the spawn, and the embryos had become free. On the 25th scarcely a trace of spawn could be detected, and nearly the whole of the adult fish had left the Forth.

Prof. Allman draws attention to the fact "that the deposit of spawn, as evidenced by the appearance of spent herrings, did not take place till about sixty-five days after the appearance of the herring in the Firth," and arrives at the conclusion that "the incubation probably continues during a period of between twenty-five to thirty days," adding however that present be regarded as only this and other evidence that w the eggs of the herring "are h to three weeks after deposition

Within the last few years a upon this question by the la Fishery Commission, to which casion to refer.[4] It has been dation is easily practised, and be kept in aquaria for as long great body of accurate inform unexpected character, has bee development of the eggs, and young herring.

It turns out that, as is the ca period of incubation is closely When the water has a temperat eggs of the herring hatch in fr age being seven days. And thi when we bear in mind the cor quiries of the Dutch meteorolo those of the Scottish Meteorolo tend, namely, that the shoals pr At 50° Fahrenheit, the period ened to eleven days; at 46° to fi lasts forty days. As the Forth i in the month of March, it is prob estimate comes very near the t case which he investigated.

The young, when they emerge one-fifth to one-third of an inch tremely unlike the adult herring tha termed larvæ. They have enormo ingly slender body, with a yelk b forepart. The skeleton is in a ve tion; there are no ventral fins; an dorsal, caudal, and anal fins, there extending from the head along th and then forwards to the yelk bag simple tube, ciliated internally; th and no branchiæ are yet developed. contractile vessel, and the blood is corpuscles. At first the larvæ do not at the expense of the yelk, which gr

Within three or four days after has increased by about half the orig yelk has disappeared, the cartilagino and the heart becomes divided int the young fish attains nearly dou before blood corpuscles are visible.

By the time the larva is two-thirds length which it attains one month primitive median fin is separated and anal divisions, but the ventral peared. About this period the youn feed on small crustacea; and it grow two months, it is 1¼ inch long, and, at attained a length of about two inches.

Nearly up to this stage the elongate retains its larval proportions; but, in t third month, the body rapidly deepens to appear, and the larva passes into t —that is, assumes the form and propo though it is not more than two inches l goes on growing at the same rate (11 mi half an inch) per month, so that, at six as large as a moderate-sized sprat.

The well-known "whitebait" of the

[1] "Report of the Royal Commission on the operation of the Acts relating to Trawling for Herrings on the Coast of Scotland (1863)," P. 28.
[2] Brandt and Ratzeburg, for example, in 1833 strongly asserted that the herring has two spawning seasons.
[3] "Report of the Royal Commission on the Operation of the Acts relating to Trawling for Herring on the Coast of Scotland, 1863."
[4] See the four valuable memoirs, Kupffer, "Ueber ebung des Herings in der westlichen Ostsee," *Jahr* des Herings im Ei"; Meyer, "Beobachtungen in des Herings"; Heincke, "Die Varietäten des Hering in the *Jahresbericht der Commission zu Kiel* Widegren's essay "On the Herring," 1871, translat U.S. Commission Reports, 1873–75, also contains im

s I have seen, almost exclusively of herrings, under
ıths old, and as the average size of whitebait
:s, from March and April onwards, until they be-
ıspiciously like sprats in the late summer, it may
cluded that they are the progeny of herrings
spawned, early in the year, in the neighbourhood
estuary of the Thames, up which these dainty
h have wandered. Whether it is the general habit
ıg herring, even of those which are spawned in
ater, to migrate into the shallow parts of the sea,
ı into completely fresh waters, when such are
ɔle, is unknown.

e Report on Trawling (1863) we observe :—

is extremely difficult to obtain any satisfactory
:e as to the length of time which the herring re-
to pass from the embryonic to the adult or *full*
on. Of the fishermen who gave any opinion on
bject, some considered that a herring takes three,
ıers that it requires seven, years to attain the full
vning condition; others frankly admitted that they
ıothing about the matter; and it was not difficult,
ittle cross-examination, to satisfy ourselves that
vere all really in this condition, however strongly
ıight hold by their triennial or septennial theories.
arrell and Mr. Mitchell suppose with more reason
erring attain to full size and maturity in about
en months.

does not appear, however, that there is any good
ıce against the supposition that the herring reaches
ıwning condition in one year. There is much rea-
believe that the eggs are hatched in, at most, from
ɔ three weeks after deposition, and that in six to
weeks more (that is at most ten weeks from the
of laying the eggs) the young have attained three
s in length. Now it has been ascertained that a
g smolt may leave a river and return to it again in a
e of months increased in bulk eight or tenfold, and
ıerring lives on very much the same food as a smolt,
ıears possible that it should increase in the same
ratio. Under these circumstances nine months
l be ample time for it to enlarge from three to ten or
n inches in length. It may be fairly argued, how-
that it is not very safe to reason analogically from
ate of growth of one species of fish to that of
ıer; and it may be well to leave the question
ıer the herring attains its maturity in twelve, fifteen,
xteen months open, in the tolerably firm assurance
he period last named is the maximum."

ı comparing these conclusions with the results of the
ul observations of the Baltic Commissioners, it
ars that we somewhat over-estimated the rate of
th of the young herring, and that the view taken
Farrell and Mitchell is more nearly correct. For
ıosing that the rate of growth after six months
inues the same as before, a herring twelve months
will be nearly six inches long, and at eighteen
ths eight or nine inches. But full herrings may be
with little more than seven inches long, and they
very commonly found not more than nine inches in
th.[1]

ishermen distinguish four states of the herring. Fry
ile, when not larger than sprats; maties, when larger
ı this, with undeveloped roe or milt; full fish, with
ely developed roe or milt; and spent or shotten
, which have recently spawned.

ıerring fry of the size of sprats are distinguished from
fish not merely by their size, but in addition, by the
y slight development of the milt or roe, and by
accumulation of fat in the abdominal cavity. Bands
fat are found in the mesentery alongside the intestine,
l filling up the interspaces between the pyloric cæca.

Ljungman ("Preliminary Report on Herrings and Herring Fisheries on West Coast of Sweden," translated in U.S. Commision Report, 1873-5) aks of full herrings ready to spawn only 100-110 mm. (4 to 4½ in.) long, as erved by himself.

Maties (the name[1] of which is a corruption of the Dutch word for a maiden) resemble the fry in these particulars; but, if they are well fed, the deposit of fatty and other nutritive matter takes place, not only about the abdominal viscera, but also beneath the skin and in the interstices of the flesh. Indeed, when nourishment is abundant, this infiltration of the flesh with fat may go so far that the fish cannot readily be preserved and must be eaten fresh. The singularly delicate Loch Fyne herrings are in this condition early in the season. When the small crustaceans, on which the maties chiefly feed, are extremely abundant the fish gorge themselves with them to such an extent that the conical crop becomes completely distended, and the Scotch fishermen give them the name of "gut-pock herrings," as much as to say pouch-gutted fish, and an absurd notion is current that these herrings are diseased. However, the "gut-pock" herrings differ from the rest only in having their pouch full instead of empty, as it commonly is.

As the fish passes from the matie to the full condition, the milt and roe begin to grow at the expense of the nutriment thus stored up; and, as these organs become larger and occupy more and more space in the abdominal cavity, the excess of nutritious substance is transferred to them. The fatty deposit about the intestine and pyloric cæca gradually disappears and the flesh becomes poorer. It would appear that by degrees the fish cease to feed at all. At any rate, there is usually no food in the stomach of a herring which approaches maturity. In all these respects there is the closest resemblance between the history of the herring and that of other fishes such as the salmon—the parr correspnding to the herring fry or sile, the grilse and the "clean fish" of larger size to the maties.

At length spawning takes place, the accumulated nutrition, transformed into eggs or spermatic fluid, is expelled, and the fish is left in that lean and depauperated state which makes a "shotten herring" proverbial. In this condition it answers to the salmon "kelt," and the milt or roe are now shrunk and flaccid and can be blown up with air like empty bags. If the spent fish escapes its myriad enemies, it doubtless begins to feed again and once more passes into the matie state in preparation for the next breeding season. But the nature of this process of recuperation has yet to be investigated.

When they have reached the matie stage, the herrings, which are at all times gregarious, associate together in conspicuous assemblages, which are called shoals. These are sometimes of prodigious extent—indeed eight or nine miles in length, two or three in breadth, with an unknown depth, are dimensions which are credibly asserted to be sometimes attained. In these shoals the fish are closely packed, like a flock of sheep straying slowly along a pasture, and it is probably quite safe to assume that there is at least one fish for every cubic foot of water occupied by the shoal. If this be so, every square mile of such a shoal, supposing it to be three fathoms deep, must contain more than 500,000,000 herrings. And when it is considered that many shoals approach the coasts, not only of our own islands, but of Scandinavia and the Baltic, and of Eastern North America, every spring and autumn, the sum total of the herrings which people our seas surpasses imagination.

If you read any old and some new books on the natural history of the herring, you will find a wonderful story about the movements of these shoals. How they start from their home in the Polar Seas, and march south as a great armada which splits into minor divisions—one destined to spawn on the Scandi-

[1] "Halecum intestina, non modo multa gaudere obesitate, sed et totum corpus eo adeo esse impletum ut aliquando, cum discinditur, pinguedo ex cultro defluat, et præsertim eo quidem tempore ubi halecum lactes aut ova crescere primum incipiunt, unde nostrates eos *Maatgens-Haringen* dicere solent."—A. v. Leeuwenhoek, "Arcana Naturæ," Ep. xcvii. (1696).

Leeuwenhoek also mentions having heard of "gut pock" herrings from Scotch fishermen.

navian, and one on our own shores; and how, having achieved this spawning raid, the spent fish make their way as fast as they can back to their Arctic refuge, there to repair their exhausted frames in domestic security. This story was started in the last century, and was unfortunately adopted and disseminated by our country-man Pennant. But there is not the least proof that anything of the kind takes place, and the probabilities are wholly against it. It is, for example, quite irreconcilable with the fact that herring are found in cods' stomachs all the year round. And the circumstance to which I have already adverted, that practised eyes distinguish local breeds of herrings, though it does not actually negative the migration hypothesis, is very much against it. The supposition that the herring spawn in the north in the early spring, and in the south in the autumn, fitted very well into the notion that the vanguard of the migrating body of herrings occupied the first spawning ground it reached, and obliged the rest of the horde to pass on. But, as a matter of fact, the northern herrings, like the southern, have two spawning times; or perhaps it would be more correct to say that the spawning time extends from autumn to spring, and has two maxima—one in August-September, and one in February-March.

Finally, there is no evidence that herrings are to be met with in the extreme north of their range, at other times, or in greater abundance, than they are to be found elsewhere.

In the matter of its migration, as in other respects, the herring compares best with the salmon. The ordinary habitation of both fishes is no doubt the moderately deep portion of the sea. It is only as the breeding time draws near that the herrings (not yet advanced beyond the matie state) gather together towards the surface and approach the land in great shoals for the purpose of spawning in relatively or absolutely shallow water. In the case of the herring of the Schlei we have almost the connecting link between the exclusively marine ordinary herring and the river ascending salmon.

The records of the herring fisheries are, for the most part, neither very ancient nor (with the exception of those of the Scotch Fishery Board) very accurately kept; and, from the nature of the case, they can only tell us whether the fish in any given year were readily taken or not, and that may have very little to do with the actual strength of the shoals.

However, there is historical evidence that, long before the time of Henry the First, Yarmouth was frequented by herring fishers. This means that, for eight centuries, herrings have been fished on the English coast, and I cannot make out, taking one year with another, in recent times, that there has been any serious fluctuation in their numbers. The number captured must have enormously increased in the last two centuries, and yet there is no sign of diminution of the shoals.

In 1864, we had to listen to dolorous prophecies of the coming exhaustion of the Scotch herring fisheries. The fact that the returns showed no falling off was ascribed to the improvement of the gear and methods of fishing, and to the much greater distances to which the fishermen extend their operations. Yet what has really happened? The returns of subsequent years prove, not only that the average cure of the decade 1869-78 was considerably greater than that of the previous decade, but that the years 1874 and 1880 are absolutely without parallel in the annals of the Scotch herring fishery, a million barrels having been cured in the first of these years, and a million and a half in 1880. In the decade 1859-68, the average was 670,000 barrels, and the highest 830,000.

In dealing with questions of biology, *à priori* reasoning is somewhat risky, and if any one tells me "it stands to reason" that such and such things must happen, I generally find reason to doubt the safety of his standing.

It is said that "it stands to reason" that destruction on such a prodigious scale as that effected by her must tell on the supply. But again let us look It is said that 2,500,000,000, or thereabouts, are every year taken out of the North Sea a lantic. Suppose we assume the number to be so as to be quite safe. It is a large number but what does it come to? Not more than herrings which may be contained in one shoal half a dozen square miles—and shoals of size are on record. It is safe to say that through the North Sea and the Atlantic, at same time, there must be scores of shoals which would go a long way towards supplying of man's consumption of herrings. I do that all the herring fleets taken together do cent. of the total number of herrings in the year, and I see no reason to swerve from the my colleagues and I expressed in our Report destructive operations are totally insignificant pared with those which, as a simple calculu must regularly and normally go on.

Suppose that every mature female herring eggs, that the fish are not interfered with b that their numbers remain approximately year after year, it follows that 998 of th of every female must be destroyed before maturity. For if more than two out of the n destruction, the number of herrings will be ately increased. Or in other words, if the avera of the shoals which visit a given locality i the same year by year, many thousand times contained in those shoals must be annually And how this enormous amount of destruction will be obvious to any one who considers the of the fin-whales, the porpoises, the gannets, the codfish, and the dogfish, which accom shoals and perennially feast upon them; to s of the flat-fish, which prey upon the newly-deposi or of the mackerel, and the innumerable small which devour the fry in all stages of their de It is no uncommon thing to find five or six— ten or twelve—herrings in the stomach of a cod in 1863, we calculated that the whole take of Scotch herring fisheries is less than the number which would in all probability have been con the codfish captured in the same waters if they left in the sea.[1]

Man, in fact, is but one of a vast co-operative herring-catchers, and the larger the share he take there is for the rest of the company. If man t the other shareholders would have a larger divi would thrive and multiply in proportion, but come to pretty much the same thing to the her

As long as the records of history give us inf herrings appear to have abounded on the east co British Islands, and there is nothing to show, so am aware, that, taking an average of years, t ever either more or less numerous than they are at But in remarkable contrast with this constancy, th of herrings have elsewhere exhibited a chang ciousness—visiting a given locality for many great numbers, and then suddenly disappearing. well-marked examples of this fickleness are reco the west coast of Scotland; but the most remarkab furnished by the fisheries of Bohúslan, a provinc lies on the south-western shore of the Scand peninsula. Here a variety known as the "

[1] In his valuable Report on the Salt Water Fisheries of Norw Prof. Sars expresses the belief that full-grown codfishes feed exclusively on herrings.

[2] In 1877 rather more than 5,000,000 cod, ling, and hake, were the Scottish fishermen. Allowing each only two herrings a day, th would have consumed more than three thousand five hundred millio rings in a year. As to the Norwegian fisheries, 20,000,000 cod said to be taken annually by the Lofoden fishermen alone.

herring, after being so extremely abundant, for xty years, as to give rise to a great industry, disd in the year 1808, as suddenly as they made their nce, and have not since been seen in any number. lesertion of their ordinary grounds by the herring n attributed to all imaginable causes, from fishing unday to the offence caused to the fish by the osing carcases of their brethren, dropped upon om out of the nets. The truth is that absolutely is known on the subject; and that little is likely nown, until careful and long-continued meteoroand zoological observations have furnished definite tion respecting the changes which take place in perature of the sea, and the distribution of the crustacea which constitute the chief food of the shoals. The institution of systematic observations kind is an object of international importance, s the attainment of which the British, Scandinavian, and French Governments might wisely make a ied effort.

eat fuss has been made about trawlers working over wning grounds of the herring. "It stands to reason," re told, that they must destroy an immense quanthe spawn. Indeed this looked so reasonable, ve inquired very particularly into a case of the l malpractice which was complained of on the ast of Scotland, near Pittenweem. Off this place, is a famous spawning ground known as the Traith and we were told that the trawlers worked vigorover the spot immediately after the herring had ited their spawn. Of course our first proceeding was the trawlers why they took the trouble of doing looked like wanton mischief. And their answer easonable enough. It was to catch the prodigious lance of flat-fish which were to be found on the a at that time. Well, then, why did the flat-fish conte there? Simply to feed on herring eggs, which to be a sort of flat-fishes' caviare. The stomachs flat-fish brought up by the trawl were, in fact, med with masses of herring eggs.

us every flat-fish caught by the trawl was an enerdestroyer of herring arrested in his career. And the ng, instead of injuring the herring, captured and ed hosts of their worst enemies. That is how ood to reason" when one got to the bottom of the r.

not think that any one who looks carefully into the ct will arrive at any other conclusion than that ied by my colleagues and myself: namely, that the thing for Governments to do in relation to the ng fisheries, is to let them alone, except in so far as olice of the sea is concerned. With this proviso, let le fish how they like, as they like, and when they

At present, I must repeat the conviction we essed so many years ago, that there is not a icle of evidence that anything man does has an reciable influence on the stock of herrings. It will ime to meddle, when any satisfactory evidence that chief is being done is produced

NOTES

THE fifty-first Annual Meeting of the British Association for Advancement of Science will commence at York on Wednes., August 31, 1881. The President-Elect is Sir John Lubbock, t, M.P., F.R.S. Vice-Presidents Elect: His Grace the Archop of York, D.D., F.R.S.; the Right Hon. the Lord Mayor York; the Right Hon. Lord Houghton, F.R.S.; the Ven. hdeacon Creyke, M.A.; the Hon. Sir W. R. Grove, F.R.S.; f. G. G. Stokes, Sec. R.S.; Sir John Hawkshaw, C.E., .S.; Allen Thomson, M.D., F.R.S. L. and E.; Prof. Allen, M.D., F.R.S. L. and E. General Secretaries: Capt. uglas Galton, C.B., D.C.L., F.R.S.; Philip Lutley Sclater, Ph.D., F.R.S. Acting Secretary: George Griffith, M.A., F.C.S., Harrow; General Treasurer: Prof. A. W. Williamson, F.R.S., University College, London, W.C. Local Secretaries: Rev. Thomas Adams, M.A.; Tempest Anderson, M.D., B.Sc., York. Local Treasurer: W. W. Wilberforce, York. The Sections are the following:—A.—Mathematical and Physical Science.—President: Prof. Sir William Thomson, F.R.S. L. and E. Vice-Presidents.—Prof. J. C. Adams, F.R.S.; T. Archer Hirst, Ph.D., V.P.R.S. Secretaries: Prof. W. E. Ayrton; Oliver J. Lodge, D.Sc.; Donald McAlister, B.A., B.Sc. (Recorder). B.—Chemical Science.—President: Prof. A. W. Williamson, For. Sec. R.S., V.P.C.S. Vice-Presidents: F. A. Abel, C.B., F.R.S.; Prof. Odling, F.R.S. Secretaries: Harold B. Dixon, M.A.; P. Phillips-Bedson, D.Sc. (Recorder). C.—Geology.—President: Andrew Crombie Ramsay, LL.D., F.R.S., Director-General of the Geological Survey of the United Kingdom and of the Museum of Practical Geology. Vice-Presidents: Prof. Prestwich, F.R.S.; Prof. W. C. Williamson, F.R.S.; Secretaries: W. Topley, F.G.S. (Recorder); W. Whitaker, F.G.S. D.—Biology.—President: Richard Owen, C.B., F.R.S. Vice-Presidents: Prof. W. H. Flower, F.R.S.; Prof. J. S. Burdon Sanderson, F.R.S. Secretaries: G. W. Bloxam, M.A., F.L.S.; W. L. Distant; W. A. Forbes, F.Z.S.; Prof. M'Nab, M.D.; John Priestley; Howard Saunders, F.L.S., F.Z.S. Department of Zoology and Botany.—Richard Owen, C.B., F.R.S. (President), will preside. Secretaries: Prof. M'Nab, M.D. (Recorder); Howard Saunders, F.L.S., F.Z.S. Department of Anthropology.—Prof. W. H. Flower, F.R.S. (Vice-President), will preside. Secretaries: G. W. Bloxam, M.A., F.L.S. (Recorder); W. L. Distant. Department of Anatomy and Physiology.—Prof. J. S. Burdon Sanderson, F.R.S. (Vice-President), will preside. Secretaries: John Priestley (Recorder); W. A. Forbes, F.Z.S. E.—Geography.—President: Sir J. D. Hooker, K.C.S.I., C.B., F.R.S. Vice-Presidents: Francis Galton, F.R.S.; Prof. Sir C. Wyville Thomson, F.R.S. L. & E. Secretaries: H. W. Bates, Assist.-Sec.R.G.S., F.L.S.; E. C. Rye, Librarian R.G.S., F.Z.S. (Recorder). F.—Economic Science and Statistics.—President: The Right Hon. M. E. Grant Duff, M.P., F.R.S. Vice-Presidents: Sir George Campbell, K.C.S.I., M.P.; James Heywood, F.R.S. Secretaries: Constantine Molloy (Recorder); J. F. Moss. G.—Mechanical Science.—President: Sir W. G. Armstrong, C.B., F.R.S. Vice Presidents: W. H. Barlow, F.R.S., Pres.Inst.C.E.; C. W. Siemens, D.C.L., F.R.S. Secretaries: A. T. Atchison, M.A. (Recorder); H. Trueman Wood, B.A. Tickets for the meeting may be obtained of the Local Secretaries at York, and at the Office of the Association, 22, Albemarle Street, London, W.; or on application by letter, from August 17 to August 24, to the General Treasurer, Prof. A. W. Williamson, British Association, University College, London, W.C. The First General Meeting will be held on Wednesday, August 31, at 8 p.m. precisely, when A. C. Ramsay, F.R.S., V.P.G.S., Director-General of the Geological Survey of the United Kingdom, and of the Museum of Practical Geology, will resign the chair, and Sir John Lubbock, Bart., M.P., F.R.S., President-Elect, will assume the presidency, and deliver an address. On Thursday evening, September 1, at 8 p.m., a *soirée;* on Friday evening, September 2, at 8.30 p.m., a discourse by T. H. Huxley, LL.D., Sec.R.S., Professor of Natural History in the Royal School of Mines; on Monday evening, September 5, at 8.30 p.m., a discourse by W. Spottiswoode, D.C.L., LL.D., President of the Royal Society; on Tuesday evening, September 6, at 8 p.m., a *soirée;* on Wednesday, September 7, the concluding general meeting will be held at 2.30 p.m. No report, paper, or abstract, can be inserted in the Report of the Association unless it is given in before the conclusion of the meeting. Excursions to places of interest in the neighbourhood of York

will be made on the afternoon of Saturday, September 3, and on Thursday, September 8.

THE honorary degree of LL.D. has been conferred on the following gentlemen by the University of Glasgow:—F. M. Balfour, M.A., Fellow of Trinity College, Cambridge; Dr. Angus Smith, F.R.S., Government Inspector of Alkali Works; Prof. Richard Owen, C.B., F.R.S., Superintendent of Natural History Collections of the British Museum; Andrew Buchanan, M.D., Emeritus Professor of Physiology in the University of Glasgow.

THE honorary degree of LL.D. has been conferred by the University of Edinburgh on Prof. A. W. Williamson, of University College, London.

IT is intended to celebrate in Edinburgh the centenary of the birthday of Sir David Brewster, on December 9, by a public dinner.

THE annual meeting of the Iron and Steel Institute will be held in London on May 4, 5, and 6. On May 4 the Bessemer Medal for 1881 will be presented to Mr. William Menelaus, and the president-elect (Mr. Josiah T. Smith) will deliver his inaugural address. The following is the list of papers to be read:—On the Results of Experiments relative to Corrosion in Iron and Steel, by Mr. William Parker of Lloyd's Registry, London; On the Manufacture of Armour Plates, by Mr. Alexander Wilson, Sheffield; On the Manufacture of Steel and Steel Plates in Russia, by Mr. Sergius Kern, St. Petersburg; On the Use of Steel for Shipbuilding, by Mr. William Denny, Dumbarton; On some Physical Properties of Cast Iron, by Mr. Charles Markham, Staveley; On the Desulphurisation of Iron, by M. Rollet, St. Chamond, France; On Iron and Steel Permanent Way, by Mr. R. Price Williams, London; On Hydraulic Appliances for the Bessemer Process, by Mr. Michael Scott, London; On the Manufacture of Bessemer Steel and Steel Rails in America, by Capt. Jones, Edgar Thomson Steel Works, Pittsburg, U.S.A.; On Hydrogen and Carbonic Oxide in Iron and Steel, by Mr. John Parry, Ebbw Vale; On the Preservation of Iron and Steel Surfaces, by Mr. George Bower, St. Neots; On a new method for the determination of Oxygen in Iron and Steel, by Mr. Alex. E. Tucker, Rhymney.

DURING the Summer Term of the City and Guilds of London Institute, commencing May 2, 1881, Prof. Armstrong, Ph.D., F.R.S., and Prof. Ayrton, A.M., Inst.C.E., will continue their tutorial and laboratory courses of instruction in chemistry and physics as applied to the arts and manufactures, at the Cowper Street Schools, pending the present erection of the City and Guilds of London Technical College, Finsbury, the foundation stone of which will be laid by Prince Leopold on May 10. There are both day and evening classes at the institute, with means for ample laboratory practice, at fees which place the education within reach of all classes. We would specially draw attention to the fact that these classes and the laboratory practice are open, at an almost nominal fee, to female as well as to male students. For every hour of lecture there are two hours laboratory work included in this nominal fee. The day classes would be of service to girls who have not the means to obtain a Girton or a Newnham education, while the evening classes will be of great use to those women who take more than a mechanical interest in their daily work; for from the course of instruction and their own work in the laboratory they will gain such a thorough knowledge of principles as should distinguish a skilled workwoman from a mere machine.

THE Annual Report for the past year of the Jamaica Public Gardens, by Mr. D. Morris, the new director, is one of great interest. As the year has been the first under the new organisation, the chief work has naturally been of a departmental character, but from the details given, it is evident that important [illegible] been made in developing several industries which [illegible] important influence for good on the future of the [illegible] the variation in altitude of the different [illegible] Morris's charge excellent opportunities are [illegible] menting on various kinds of cultivation, and those [illegible] prepared to take full advantage of. Among the [illegible] concerning which interesting information is [illegible] Report, are Cinchona, Liberian Coffee, Sugar Cane, [illegible] Mahogany, Pine-Apples, Jalap, Cacao, Tobacco, [illegible] various spices, Oranges, Bananas Fibre, &c. The [illegible] may be looked for from Mr. Morris's vigorous and [illegible] directorship.

WE have also a very satisfactory Report of work [illegible] ending March 31, 1880, from Mr. Duthie, superintendent [illegible] Government Botanical Gardens at Saharanpur and [illegible] As in Jamaica, experiments, some of them very [illegible] been carried on in the rearing of various useful plants, [illegible] vegetable and medicinal plants. Much difficulty [illegible] experienced by Mr. Duthie in training *Malkie* for [illegible] gardens, and he has some trials before him ere he [illegible] turn out a staff of properly-trained natives.

MR. M. G. MULHALL sends us the following [illegible] which we give without comment:—"Although Shakespeare [illegible] supposed to have taken the idea of Hamlet from the [illegible] historian Saxo-Grammaticus, there are such points of resemblance [illegible] with the Arabic chronicle of Nigiaristan, respecting Mohammed [illegible] tenth Caliph of Bagdad, that I venture to call your attention [illegible] the same. The points of analogy are as follows: [illegible] Montasser is murdered by putting poison in his ear. 2. The [illegible] ghost scene, in which his father appears to him. 3. The [illegible] playing of tapestry before the Caliph and his court, in which [illegible] the tapestry represents a tragedy identical with the late [illegible] murder."

THE *Daily News* New York correspondent telegraphs that [illegible] aldermen have passed, over the mayor's veto, the ordinance [illegible] giving the Edison Electric Lighting Company permission [illegible] tubes in the streets. "The company will proceed [illegible] to introduce its new electric lamps in the offices in the [illegible] portion of the city around Wall Street. The construction [illegible] the lamp is simple. It consists of a small bulbous glass [illegible] four inches long, an inch and a half in diameter, with a [illegible] loop which becomes incandescent when the electric [illegible] passes through. Each lamp is of sixteen candle-power, with [illegible] perceptible variation in intensity. The light is turned on [illegible] with a thumbscrew. Wires have already been put into [illegible] buildings. The company will compete with the gas companies [illegible] by charging the same rates. If the latter reduce, the [illegible] Company will also reduce, and are prepared to go lower than [illegible] gas companies can."

AT five o'clock on Saturday morning a strong shock of [illegible] quake was felt at Paola in the province of Calabria. On the [illegible] night of April 19 there was another severe shock of earthquake [illegible] at Chios.

A NEW illustrated work on the Butterflies of Europe [illegible] we understand, in active preparation by Dr. Lang, F.L.S. [illegible] publication, in monthly parts, will be commenced very [illegible] by Messrs. Lovell, Reeve, and Co.

MRS. BURTON, the wife of the well-known Capt. R. [illegible] our Consul at Trieste, is evidently doing a good work in that [illegible] in teaching the people kindness to animals. The [illegible] evidently much needed, and judging from Mrs. Burton's [illegible] at her last fête and distribution of prizes, her efforts are meeting [illegible] with decided success. Of course all this costs money; [illegible] some of our readers may be inclined to help by sending a [illegible]

CHEMICAL NOTES

IN *Journal pract. Chemie*, Herr Ceeh, in the course of a paper on the decompositions which occur during the rotting of eggs, describes experiments which he thinks establish the possibility of obtaining a good soap free from smell, by saponifying with soda the residue obtained by evaporating to dryness rotten eggs, freed from their shells. Such a dried residue yields about 10·5 per cent. of oil, fresh eggs giving about 11 per cent.

THE changes undergone by grain when stored in underground magazines have been recently studied by M. Müntz (*Compt. rend.*). The magazines of the Paris Omnibus Company are partly underground; the grain in the upper parts is, however, exposed to the influence of atmospheric changes; it is found to contain much more moisture and to be at a higher temperature than that in the lower parts. The relative amounts of deterioration in grains may be measured by the quantities of carbonic anhydride exhaled. When grain is freely exposed to air about ten times as much carbonic anhydride is given off as when the grain is kept in closed receptacles; less oxygen is absorbed than corresponds with this evolution of carbon dioxide. Normal grain contains from 11 to 19 per cent. of moisture: the greater the moisture the greater the exhalation of carbon dioxide. The amount of the gas evolved also increases with increase of temperature until a point is reached at which true chemical combustion of the carbon begins, as distinguished from the physiological combustion which has preceded it. Grain which is to be kept for any time ought to be very dry, the receptacle containing it ought to be completely closed, and all parts of this receptacle ought to be at approximately the same temperature.

MR. V. LEWES, in the same journal, describes barium pentathionate, $BaS_5O_6 . 3H_2O$, and several potassium pentathionates, prepared by slow evaporation in a vacuum of "Wackenroder's solution." These experiments appear to establish beyond doubt the existence of pentathionic acid.

DRS. DUPRÉ AND HAKE have applied their method for the estimation of carbon (*Chem. Soc. Journ.*)—viz. burning in oxygen, absorbing carbonic anhydride in baryta water, converting the barium carbonate into sulphate, and weighing as such—to the estimation of carbon in air; their experiments apparently demonstrate the presence in London air of carbon in forms other than carbonic anhydride, and probably in the form of some volatile organic compounds, not as suspended matter. Drs. Dupre and Hake claim that their method of analysis enables them to estimate carbonic anhydride, carbon in the peculiar forms already noticed, and suspended carbonaceous matter in air.

IN the same journal there is a contribution to the history of ozone by Prof. Hartley of Dublin. The main conclusions drawn from experimental data are these: Ozone is a normal constituent of the higher atmosphere, and is present therein in larger proportion than near the surface of the earth. The limitation of the solar spectrum in the ultra-violet is readily accounted for by the absorptive action of atmospheric ozone, without taking into account the possible absorptive power of nitrogen and oxygen. The blue tint of the atmosphere is probably due to ozone. It is shown in the paper that the wave-length of the extreme ray capable of absorption by considerable quantities of ozone is about 316. A quantity of 2·5 mgm. of ozone in each square centimetre of sectional area of a column of air produces, it is said, a full sky-blue tint. Incidentally experiments are described in which one volume of ozone was distinctly detected by the sense of smell in 2,500,000 volumes of air.

MR. G. S. JOHNSON has obtained ammonia (*Chem. Soc. Journal*) by passing hydrogen and (presumably) pure nitrogen over cold or moderately heated spongy platinum: when however the mixed gases were passed over hot asbestos before traversing the spongy platinum, *no* ammonia was formed. Mr. Johnson thinks that nitrogen probably exists in two forms, an active and an inactive form, the latter being produced by the action of heat on the former.

DR. DUPRÉ has introduced (*Analyst*) a slight modification into the ordinary method for observing a colour change in titrating with standard solutions, which is said to render the perception of the change very sharp and accurate. He views the liquid to be titrated through a glass cell containing a solution of the same colour as, and about equal in intensity to, the liquid itself.

M. LONGUININE has recently determined (in *Compt. rend.*) the heats of combustion of various alcohols of the allyl series, and compared the numbers with those expressing the heats of combustion of metameric aldehydes. He finds very marked differences between the two series of numbers, showing once more a distinct connection between the energy lost by a carbon compound in passing from one state to another standard state, and the structure of the molecule of that compound.

M. BERTHELOT, in continuation of his researches on compounds of metallic halogen salts with haloid acids, describes in *Compt. rend.* the action of gaseous hydrochloric and hydrobromic acids on alkali chlorides and bromides; he shows that the gaseous acids are absorbed by the dry salts with disengagement of heat, and that the products of the actions are possessed of properties which distinguish them from mere mixtures.

M. BERTHELOT also considers the reciprocal actions between alkali haloid salts and haloid acids; he shows that as a rule alkali chlorides are decomposed by hydrobromic acid, but that in some cases and under special conditions of temperature, bromides are decomposed by hydrochloric acid. The general results are shown to be in keeping with the laws of thermochemistry. That action in which most heat is evolved occurs, but the products of the action may be unstable under experimental conditions, and hence the primary change may be modified, or even reversed.

M. MÜNTZ states that his investigations have shown that traces of alcohol exist in all natural waters, whether rain, river, sea, or snow water. He describes his method of applying the iodoform test for alcohol, whereby one part can be detected in 1,000,000 parts of water.

PHYSICAL NOTES

M. LAURENT of Paris has constructed "magic mirrors" giving similar effects to those brought from Japan, but of glass silvered at the back instead of metal. By engraving patterns at the back and silvering the front surface, the mirror has a perfectly plane surface only when the air-pressures at the front and back are equal. If the air behind be compressed or rarefied the thinner parts will have relatively a greater convexity or concavity than the rest, and in the disk of light which the mirror reflects on to a wall from a luminous point the pattern engraved on the back will accordingly appear dark or light.

FROM experiments on the radiation and conduction of heat in rarefied gases (*Wied. Ann.*, No. 13) Herr Graetz finds the results in much better agreement with Stefan's law of radiation than with that of Dulong and Petit, and "it may be affirmed that in the temperature-interval from 0° to 250° C. the radiation is very nearly proportional to the fourth power of the temperature." The factor of proportionality σ (in Stefan's formula $Q = \sigma T^4$) is then that amount of heat which is radiated from one square centimetre of a substance of $-272°$ C. in a second towards a space of the absolute temperature 0° ($-273°$). By the method of least squares Herr Graetz finds

$$\sigma \text{ for glass} = 1{\cdot}0846 - 12 \frac{\text{gramme centigrade}}{\text{centim. seconds}}.$$

Certain divergences at low temperatures suggest that while the intensity of radiation grows with rising temperature, it perhaps grows differently for different heat colours.

IN a recent communication to the Munich Academy, Herren Nies and Winkelmann describe an inquiry into the volume-changes of various metals in solidifying. Of eight metals examined, six (viz. tin, zinc, bismuth, antimony, iron, and copper) were proved to undergo expansion in passing from the liquid to the solid state. For three of the metals approximate values for the amount of this expansion were obtained (tin showed an expansion of 0·7 per cent., zinc 0·2, and bismuth 3). Two metals (lead and cadmium) gave doubtful results; but the authors find some reason to believe that they also expand in solidifying. So far then the rule would appear to be general for metals.

M. TRÈVE describes in the *Comptes rendus* some curious observations from which it would appear that when light is admitted from a natural or artificial source through a slit, more light passes if the slit be horizontal than if it be vertical. M. Trève has produced photographs taken behind slits in various positions to prove that the effect is not an illusion of the eye. The phenomenon appears to us inexplicable, [illegible] requires further proof to substantiate its reality.

M. MERCADIER still continues to study radiophonic phenomena. He finds it possible to increase the effects [illegible] one tube the vibrations of several receiving disks. He finds it possible to construct tubes whose length corresponds wave-length of the vibrations radiophonically excited, and respond to the note emitted. M. Mercadier hopes by means to re-determine with increased accuracy the velocity sound in air and other gases.

WITH regard to the beats and beat-tones of harmonic [illegible] Dr. Koenig argues (*Wied. Ann.* No. 3) against Prof. [illegible] view, that these are due to harmonic tones of the lower sounding with the higher (Dr Koenig, in his former [illegible] having used strongly-excited tuning-forks). He shows phenomena may be studied with the aid of a "[illegible]" which a blast of air is sent through a slit against the border of a rotating disk, or of a ring-section of a [illegible] He has the border of the disk cut to represent some curve produced by combination of the curves of two [illegible] giving an air motion, when blown against, quite like two tones sounded together. The beats and beat-tone heard. With a mere wavy outline for the border at right angles one hears a quite simple tone, which [illegible] once changed to a "clang" with strong overtones, [illegible] is slanted a little. Now, with two simple tones [illegible] beat-tone heard when the slits are at right angles shows holtz's supposition) be less distinct than when, the [illegible] slanted, the overtones are brought out; whereas the [illegible] the case.

DR. KOENIG, in the same number, describes a simple apparatus for producing beat-tones. It consists of two [illegible] of different length, clamped in vertical position by the [illegible] a jointed frame, which, through an elastic connection their lower ends pressed against the cloth-covered [illegible] wheel which dips in water in a trough. The friction [illegible] the longitudinal tones and the beat-tone.

AN improved form of the Töpler air-pump has been [illegible] by Herr Bessel-Hagen (*Wied. Ann.* No. 3), with which considerably higher vacua can be reached than those which obtains with the more complicated and fragile Sprengel-Ham apparatus. The average limit of rarefaction with [illegible] be $\frac{1}{25}$ millionths of an atmosphere ($\frac{1}{25}$ in one case [illegible] other pump only gives $\frac{1}{17}$ millionth. (It is noted that Ogden Rood has obtained $\frac{1}{54}$, and in one case even [illegible] modified Sprengel.) With his highest vacua the [illegible] electricity to pass (using plate-electrodes and a [illegible] machine, with Leyden jars). He considers mercury [illegible] insulator for electricity; but shows that radiometric [illegible] depend greatly on its pressure *in vacuo*. No [illegible] hydrogen through the glass could be detected.

AN artificially-formed body showing polar effects [illegible] of attraction and direction is produced by Herr Hess (*Wied. Ann.*, No. 3) thus: To one end of a short glass rod [illegible] a plane piece of glass, and to this a short narrow glass [illegible] a line with the rod). In the tube is placed a screw, [illegible] longer than it, and carrying at its head a *thin* paper [illegible] (22 mm. across), which has attached on one half of [illegible] phery, reaching over both above and below, a pasteboard [illegible] (10 mm. broad); opposite this, on one of the surfaces, [illegible] a small projecting point of tin-foil. Brought between [illegible] disks fixed to the rods of a Holtz machine, the tin-foil always turned to the positive pole. Next, the glass rod [illegible] disk was attached to the end of a light horizontal [illegible] hung bifilarly, and so brought between the hollow disks, disk first turned into position, and was then attracted to the negative pole. The phenomena are thought to [illegible] unipolar conductivity.

THE simple tourmaline-pincette, by reason of its [illegible] can be used with only a small number of crystals. To the field M. Bertin has applied to it a part of the [illegible] polarising microscope. This, it is known, consists [illegible] polariser and focus; second, of a microscope and [illegible] polariser and analyser, at the extremities, are pretty [illegible] and if replaced by two tourmalines placed between the [illegible] the microscope (of simplified form) the apparatus [illegible] much smaller and handier [illegible] principle of the [illegible] new tourmaline-pincette [illegible] will be found [illegible]

or March). It showed very well the fringes 3 in diameter and ¼ mm. in thickness, and ive fringes in it. With the old pinnette ds can be observed (nitre and lead crystal), ur angle of the axis being about 17°; but nt, a small calamine plate, with axes 78° fringes well.

August (*Jour. de Phys.*, March) the psyer form, may give pretty good indications observers, in these regions (France), so long re-sure is not far from 760 mm., the wet above 12° or 2°, and the difference of the ains below 12°; but otherwise the ordinary ory.

mospheric electricity on the vegetation of ified near Palermo by M. Macagno (*Jour.* Sixteen stocks were rendered more subject electric tension by means of a copper wire h platinum point in the upper end of the mother wire connected the bottom of the und. This continued from April to Sepion of vegetation was proved by the wood ining less mineral matters and potash than ocks, while the contrary occurred in the e potash was mostly in the bitartrate formantity of must was got from the grapes of d considerably more glucose and less acid.

ts of the electric phenomena which occur s and gases has been attempted by Herr lin (*Wied. Ann.*, No. 2). He worked with two circular plates of a given metal, the nected with an electrometer and submitted ss gases or to vacuum; the lower connected y of electricity from a known source requirted to the upper plate to make its potential as measured. *Inter alia*, ozone was found nan, and brass negative to a plate of the Hydrogen always made platinum strongly luence on gold was hardly perceptible, and g various. Chlorine made platinum negative (from aqueous solution) made brass positive, nce of potential with as similar treatment en pair of plates was very different in the of a series. Nor could a certain relation en it and the time of action of the gas. It wo platinum plates, one in hydrogen (viz. ally decreased to a point generally somewhat eginning. As to the cause of this decrease, probable that a gradual neutralisation of the es takes place.

VELOPMENT OF HUMAN INTELLIGENCE

ent of Education of the American Social sociation has issued the following Cir, which we commend to the notice of e of whom may be able to give Mrs. the questions given below:—

ible familiar with the habits of plants and eful investigations which have from time to d—the intelligence of animals, even, coming attention. One author alone contributes a d pages upon "Mind in the Lower Animals." tors in this country have been chiefly thinke natural development of a single child is Noah's ark full of animals. Little has been t least little has been recorded. It is certain others might contribute observations of their development that might be at some future ic psychologist. To this belief the Education American Social Science Association has ying Register, and asks the parents of very terest themselves in the subject—

; the importance of the study of the youngest

the simplest manifestations of their life and

3. By answering fully and carefully the questions asked in the Register.

4. By a careful record of the signs of development during the coming year, each observation to be verified, if possible, by other members of the family.

5. By interesting their friends in the subject and forwarding the results to the secretary.

6. Above all, by *perseverance* and exactness in recording these observations.

From the records of many thousand observers in the next few years it is believed that important facts will be gathered of great value to the educator and to the psychologist.

Boston, March 1, 1881

In connection with the inquiry indicated above, the following letter from Dr. Preyer of Prussia, addressed to Mrs. Talbot, will be found of interest:—

Jena, November 22, 1880.

DEAR MADAM,—It has given me much pleasure to read your letter and the extract of a paper of mine on "psychogenesis," or "the growth of volition, intellect, &c., in infants," and I readily comply with your wish to have this paper sent off without delay. You will find it reprinted in the book accompanying this letter, p. 199–237. I am about to publish an extensive work on the same subject, which is to contain all my observations and a careful analysis of the phenomena which the development of the faculty of speech presents. This book is to be printed next year. I am sorry to say that a reliable investigator of the whole subject is not known to me. Your newspaper seems to be right in calling the field "as yet almost unbroken." Prof. Kussmaul's "Seelenleben des neugeborenen Menschen" (Leipzig and Heidleberg, 1859), and Mr. C. Darwin's biographical sketch of an infant, contain some good observations, but both are very short. Many excellent remarks on infants and very young children I find in Mr. C. Darwin's book, "On the Expression of the Emotions." The German books on the subject, although numerous, are nearly worthless; many are sentimental, giving no facts, or, what is worse, false statements. B. Sigismund's "Kind und Welt" (1851) is an exception.

The case you mention of a child of eleven months expressing

its wishes and inducing the nurse to comply with them cannot be definitely looked at as a case of self-consciousness, but only of consciousness. This is one of the most intricate questions to decide—*when* the child distinguishes its own body, head, hands, &c., from other objects, as belonging to himself. The first time a child says "I" and "me," in the correct sense, it may be considered to have passed the limit. The formation of ideas by associating impressions, as well as the formation of general ideas (*Begriffe*) by uniting similar qualities of different objects, is intellectual work done by the child long before it knows anything of its own individuality. It seems to me that self-consciousness does not arise suddenly, but by degrees, after many experiments have shown the difference between touching his own body and external objects with his little hand.

I have been occupied with psychogenetical problems since nearly four years, continually collecting facts. Should you be able to awaken some interest for these most important investigations (I mean the physiology and psychology of infants), I think the trouble taken would soon be repaid by the results.

I am, sincerely,

DR. WM. PREYER, Professor

P.S.—Perhaps the observations and experiments on the senses (sight, hearing, smell, taste) of new-born animals and infants which I published in *Kosmos* (Zeitschrift herausgegeben von E. Krause), vol. iii. pp. 22–37, 128–132 (1878, Leipzig), may have some little interest. In England Romanes has written very able papers on the development of instinct and intelligence. His address is 18, Cornwall Terrace, Regent's Park, London.

Yours, &c., W. P.

ABNORMAL BAROMETRIC GRADIENT BETWEEN LONDON AND ST. PETERSBURG IN THE SUN-SPOT CYCLE

BEFORE alluding to the subject which forms the heading of the present communication, I must apologise for having allowed some rather serious errors to creep into the figures given for the barometric abnormals of London in my letter to NATURE, vol. xxiii. p. 243. The errors were caused by a friendly computer taking the differences from the mean for each year incorrectly in one or two cases.

I am glad to say however with respect to the relation between the barometric abnormals as there given and the sun-spot numbers, that far from its being vitiated by the corrections which have now been made, they on the contrary considerably strengthen it, as is evident when the following corrected values for the mean cycles are compared with those given in my former letter:—

LONDON

Annual Barometric Abnormals, Mean Cycles

	Maximum years in fifth line. Pressure (1811–77)	Sun-spots (1811–77).	Minimum years in seventh line Pressure (1816–79).	Sun-spots (1816–79).
1.	+0·011	−33·9	−0·006	+23·3
2.	+0·024	−23·4	−0·003	+14·5
3.	+0·017	0·0	−0·002	+ 4·8

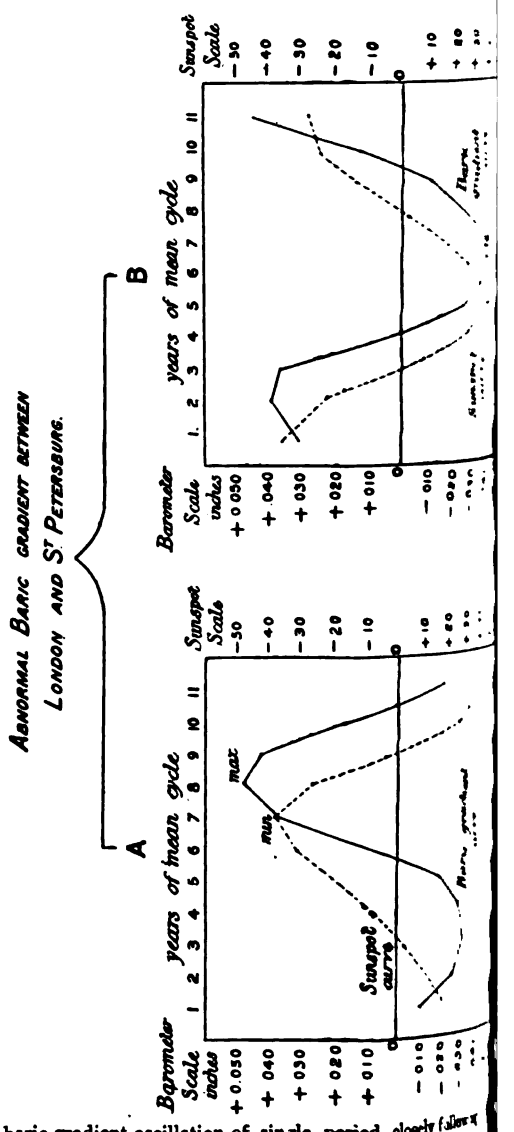
6.	−0·012	+34·2	−0·002	−32·5
7.	−0·008	+16·8	+0·003	−37·1
8.	±0·000	+ 0·2	+0·020	−25·4
9.	+0·002	−14·2	+0·025	+ 1·8
10.	+0·010	−24·2	+0·010	+30·9
11.	+0·008	−26·3	−0·009	+44·8

If now we take these corrected figures, and subtract from them those given in NATURE, vol. xx. p. 28, for St. Petersburg (reduced to inches), which comprise very nearly the same period, we get for the abnormal annual baric gradient from London to St. Petersburg in each year of the mean cycle, the following figures:—

Abnormal Annual Barometric Gradient between London and Petersburg

	(B) Maximum years in fifth line. Pressure. London–St. Petersburg (1811–77). (1822–71).	Sun-spots (1811–77).	(A) Minimum years in seventh line. Pressure. London–St. Petersburg (1816–79). (1822–71).
	inches.		inches.
1.	+0·032	−33·9	−0·012
2.	+ ·038	−23·4	− ·027
3.	+ ·036	0·0	− ·033
4.	+ ·007	+28·2	− ·029
5.	− ·029	+43·1	− ·018
6.	− ·040	+34·2	+ ·010
7.	− ·040	+16·8	+ ·036
8.	− ·025	+ 0·2	+ ·048
9.	− ·012	−14·2	+ ·041
10.	+ ·013	−24·2	+ ·016
11.	+ ·043	−26·3	− ·018

An inspection of these figures at once reveals the exist-



baric gradient oscillation of single period, closely following inverse sun-spot oscillation.

e constancy of the lag in the occurrence
s behind those of the sun spots, as well
arity in form of the two oscillations, I
have figures graphically in the accom-
which the barometric gradient abnormals are
ously with the *inverted* sun-spot ab-

at there is an almost uniform lag in the
hind the inverted sun-spot curve of a
while a variation of ·01 inches on the
onds very nearly throughout (allowance
to 10 on the sun-spot scale.
e prevailing west and south-west winds
ecessarily depend on the amount of the
places on the edge of the European
and those inland, and to the north as St.
r ground for concluding that the west
ast on the whole be stronger in years of
in those of maximum sun-spot.
e in favour of this notion has already
NATURE by Mr. S. A. Hill and Mr.
Observatory.

e Bay of Bengal during the south-west
inches in 100 miles.
from London to St. Petersburg is about
maintain a current of air between them
al to that of the summer monsoon in the
uld have to be a total annual barometric
s. As the range of the abnormal gradient
ounts to 0·08 inches it should cause a
ual to one-fourth that of the monsoon.
t the normal mean annual gradient from
ng is 0·098 inches. The variation of
e nearly equal to the normal gradient.
t obtained with the e given by Mr. H.
cle in NATURE, vol. xxi. p. 477, it may
e is a barometric "see-saw" between
ria and the Atlantic coasts of Europe,
the former districts and Indo-Malaysia.
e the relation will probably be found to
winter months, and may also be found to
erous facts already ascertained regarding
ll, cloud, and temperature of Western
chs of the sun-spot cycle.

E. DOUGLAS ARCHIBALD

THE FRENCH LEARNED SOCIETIES

ongress of the French Learned Societies
ree days, but has exhibited an unusual
lany papers were read in the section of
M. Milne-Edwards, the veteran member

ed the results of rotation of the wind as
ters at an altitude where it is not to be
tion should interfere. The number of
to south was 113. Of these 83 were
, or by east, and only 30 by west; 49 of
ntinued to the west, and 34 stopped at
consequently when a wind has come from
he greater probability is that it will con-
e. When it has rotated to the west the
ter that it will continue to the north.
ree quarter rotations observed not less
l, and only 17 stopped at the west and
ng cannot be said of the negative rota-
a north to east, and of these only 6 were
west. These results are a confirmation
law.
e director of the Pic du Midi Observa-
e new buildings on the top of the moun-
and that next winter he will use them
is curious that the fact winter has been
s in this exalted altitude.

M. Hébert read a long paper on the formation of cyclones, which he explains by the influence of mountain ranges on the great atmospheric currents loaded with humidity.

M. Vidal presented a photometer based on the action of light on a selenium element of the ordinary construction. M. Vinot, editor of *Le Ciel*, presented a refractor mounted equatorially, of which the price is less than 10*l*., with a magnifying power of 150. M. Joubert gave details on the working of the Trocadéro Popular Observatory, which is now in constant operation, and where lectures on astronomical subjects are delivered regularly.

M. Guillemare read a paper on the use of soleine for lighting purposes. This product has been obtained by the distillation of a number of resinous matters, which have a point of ebullition from 150 to 160 Centigrade and a mean density of 0·860. When they have been freed from every other matter they can be used in a specially-prepared burner. This soleine can be prepared in immense quantities in all countries where pines are abundant.

A number of interesting communications were made on palæontology and zoology, generally advocating Darwinian views.

The final sitting was presided over, as usual, by the Minister of Public Instruction, and took place in the large hall of the Sorbonne. A number of crosses of honour and medals were distributed.

UNIVERSITY AND EDUCATIONAL INTELLIGENCE

OXFORD.—The lectures of the summer term commence this week. At the University Museum Prof. Clifton will conduct a class in practical physics and will lecture informally on the use of optical instruments. Mr. Stocker will give an experimental lecture in mechanics, and Mr. V. Jones will lecture on mechanical problems, in continuation of their courses last term. Prof. Odling will continue his course of lectures on organic chemistry, and Mr. Fisher will finish his inorganic course.

At Christ Church Mr. Harcourt lectures on the metals, and Mr. Baynes on the theory of gases. At Balliol Mr. Dixon gives an experimental lecture in elementary physics.

In a Congregation holden on Tuesday, April 27, it was resolved that candidates, not being members of the University, may present themselves at any of the ordinary examinations for Responsions. Last term a statute was passed instituting an examination to take place in the Long Vacation. This examination, which can be passed by candidates before matriculation into the University, is to be passed in lieu of Responsions. The effect of the statute will be that all young men may pass Responsions before they matriculate, and less of their University time will be consumed in getting up school work.

The proposal to designate the unattached students as students of the University Hall was lost by a large majority, 99 voting against the proposal and only 9 for it.

SOCIETIES AND ACADEMIES

LONDON

Chemical Society, April 21.—Dr. Debus in the chair.—It was announced that a ballot for the election of Fellows would take place at the next meeting, May 5.—The following papers were read:—On the distillation of mixtures of carbon disulphide and carbon tetrachloride, by F. T. Brown. The objects of the research were to find the boiling-point of every possible mixture of the two liquids, and the composition of the vapour evolved by any mixture when boiling. Tables and curves giving these results accompany the paper. The author also finds that the composition of the vapour evolved is independent of the pressure under which ebullition takes place.—On the estimation of hydric peroxide by means of potassic permanganate, by W. E. Adeney.—On the oxidation of sulphurous acid, by H. E. Dixon. The author finds that when sulphur dioxide, steam, and oxygen are exposed to a temperature of 100° C. no diminution of volume takes place, and therefore no sulphuric acid is formed. If the temperature be allowed to fall so that water condenses, a slight contraction in volume is observed.—On the reduction of cinnamic alcohol, by F. Hatton and W. R. Hodgkinson. When this substance is heated to 100° C. for three or four days

with sodium amalgam (containing 15 per cent. sodium), and a small quantity of water cinnamene and methylic alcohol are produced.

Entomological Society, April 6.—W. L. Distant, vice-president, in the chair.—One Ordinary and one Honorary Member were elected.—Mr. J. Jenner Weir exhibited an undetermined *Noctua*, apparently allied to the genera *Dicycla*, or *Gortyna*, which was found in a nursery garden at Blackheath in August last.—Mr. R. McLachlan exhibited three rare species of the Neuropterous genus *Dilar*, Rambl.—Rev. A. E. Eaton exhibited a specimen of *Haplophthalmus elegans*, Schöbl., a woodlouse new to the British fauna.—Miss E. A. Ormerod exhibited two termites' nests from British Guiana.—Mr. T. R. Billups exhibited specimens of two rare British insects—*Ichneumon erythrinus*, Gr., and *Lasiosomus enervis*, Herr. Schäff.—The Secretary announced the death of Herr J. H. C. Kawall, a well-known entomologist of Courland, at the age of eighty-two.—Mr. R. McLachlan read a description of a new species of *Cordulina* (*Gomphomacromia fallax*) from Ecuador.—Mr. J. B. Bridgman communicated a paper entitled "Some Additions to Mr. Marshall's Catalogue of British *Ichneumonidæ*." Upwards of sixty species (most of which were exhibited to the meeting) were noticed as new to the British fauna, including thirteen new to science.

Meteorological Society, April 20.—Mr. C. Greaves, F.G.S., vice-president, in the chair.—W. H. Goss, F.G.S., and Admiral J. L. Massie were elected Fellows of this Society.—The following papers were read:—On the frequency and duration of rain, by Dr. Wladimir Köppen of Hamburg.—Results of experiments made at the Kew Observatory with Rogen's and George's barometers, by G. M. Whipple, B.Sc., F.R.A.S.—On a discussion of Mr. Eaton's table of the barometric height at London with regard to periodicity, by G. M. Whipple, B.Sc., F.R.A.S.

Anthropological Institute, April 12.—F. W. Rudler, F.G.S., vice-president, in the chair.—The election of Lieut.-Col. R. G. Woodthorpe, R.E., and of Thomas Vincent Holmes, F.G.S., was announced.—Mr. Joseph Lucas read a paper on the ethnological relations of the Gypsies. In tracing back the past history of the races described under the common name of Gypsies we pass through two periods—the first *historical*, dating from A.D. 1414; the second partly historical, partly inferential. This older section formed the subject of Mr. Lucas's paper. The author premised that linguistic evidence shows that the various tribe of Gypsies now scattered over Europe can be referred to several Eastern tribes from India to Persia. The investigation dates back to archæological times, especially in relation to the working of metals and the presence of a large number of pure Sanscrit words in the language of European Gypsies, many of which do not occur in Hindustani. The "archæological" section embraces all that was not included under the several sections—"The Gypsies in Egypt," "Gypsies among the Romans," or "The Dark Ages"; but a good deal of the evidence upon which the archæological conclusions rest runs through those several sections, as well as through sections specially devoted to the names *Zingáro* and *Rom*. It will thus appear that the term "Gypsy" is used by the author in the widest sense as meaning "an Asiatic tribe which has wandered into Europe," though strictly it should mean only those who came by way of Egypt.

PARIS

Academy of Sciences, April 18.—M. Wurtz in the chair.—The following papers were read:—Microscopic inscription of movements observed in physiology, by M. Marey. The accuracy of the curves from M. Marey's instruments has been doubted, on the ground that vibrations proper to the light lever may be added to the physiological movement. He now removes this objection by greatly diminishing the range and velocity of the lever so as to give microscopic curves on smoked glass (which is also moved more slowly). The inertia of the lever becomes negligible. The curves, when examined in the microscope or by projection, are found identical with the others. The method greatly extends the field of phenomena that may be registered, *e.g.* the vibrations of blood in the vessels, which give a sound, produce a distinct microscopic trace. The portable character of the apparatus is an advantage.—On the Eulerian integral of the second species, by M. Gyldén.—On the surface of Kummer with sixteen singular points, by M. Brioschi.—On the action of beat on ammoniated bases, by M. Hofmann.—Report on a memoir of M. Perisé, entitled "Causes which tend to warp the Girders of Iron Bridges, and Means of [illegible] these Girders for Resistance of Warping Force," [illegible] secondary battery of M. Faure, by M. Keyser.—Improvement on M. Planté's, M. Faure quickly [illegible] power of almost unlimited accumulation by [illegible] two sheets of lead are each covered with minium [illegible] oxide of lead, then with a felt envelope held [illegible] They are then placed near each other (in [illegible] acidulated water. The electric current changes [illegible] peroxide on the positive electrode, and to [illegible] negative. On discharging, the reduced lead is [illegible] peroxidised lead reduced. A quantity of [illegible] giving 1-horse power for one hour may be [illegible] battery of 75 kg. The battery, under certain [illegible] 80 per cent. of the work expended in charging [illegible] Ampère to Lacroix was read. It was written [illegible] fessor in the Lyceum of Lyons, and expresses [illegible] mathematical studies.—On the earthquake of [illegible] Pelissier, Consul-General at Smyrna. The [illegible] first oscillation, on the afternoon of April 3, was [illegible] between 0·15 m. and 0·20 m. From then till the [illegible] were felt, thirty or forty of which were capable [illegible] down a solid wall. All the oscillations were [illegible] east to west. The Governor's palace, of very light [illegible] but chained throughout at the level of each storey, [illegible] the shocks, while the wall inclosing the ground, [illegible] was everywhere thrown down. Smyrna has been [illegible] for the wounded.—On Fuchsian functions, by M. Poincaré.—On Abelian functions, by the same.—On a class of [illegible] logarithms of which are sums of Abelian integrals of the first and third species, by M. Appell.—On the representation of functions (continued), by M. Reymond.—On stellar photography, by Prof. H. Draper. By exposing 140 minutes in the telescope, he has succeeded in photographing stars of magnitude 14·1, 14·2, and 14·3 (Pickering's scale). The weakest is of the magnitude on Herschel's scale. The minimum of visibility of the 9-inch telescope used has been thus nearly reached. Mr. Draper hopes soon to be able to go still further.—Action of light extends over a surface about 15′ in diameter.—Action of light on toluene, by M. Renard.—Structure and [illegible] texture of the ink-bag in cephalopoda of the French coast (continued), by M. Girod. The species observed were *Sepia officinalis*, *Loligo vulgaris*, *Sepiola Rondeletii*, and *Octopus vulgaris*.—The large dunes of sand of the Sahara, by M. Rolland. These move toward the south-east, and the sum of sand is almost insensible in a generation.

C. KEGAN PAUL & CO.'S LIST.

Crown 8vo, cloth, 5s.

SIGHT: An Exposition of the Principles of Monocular and Binocular Vision. By JOSEPH LE CONTE, LL.D., Professor of Geology and Natural History in the University of California. With 132 Illustrations.

"Vol. XXXIII. of "The International Scientific Series."

Second Edition.

GENERAL PHYSIOLOGY of MUSCLES and NERVES. By Prof. J. ROSENTHAL. Crown 8vo, with Illustrations, cloth, 5s.

"Vol. XXXII. of "The International Scientific Series."

"A well-written and careful summary of existing knowledge by a patriotic compatriot authority, set forth in as simple language as is consistent with the very abstruse nature of the problems discussed."—*St. James's Gazette.*

Second Edition.

The NATURAL CONDITIONS of EXISTENCE as they AFFECT ANIMAL LIFE. By KARL SEMPER. With 106 Illustrations, crown 8vo, cloth, 5s.

"Vol. XXXI. of "The International Scientific Series."

"Unquestionably one of the most interesting contributions to zoological literature that has appeared for years. . . . The book is very freely illustrated with well-executed woodcuts."—*Popular Science Review.*

Second Edition.

THE ATOMIC THEORY. By Prof. WURTZ. Translated by E. CLEMINSHAW, F.C.S. Crown 8vo, cloth, 5s.

"At once a scientific treatise and an artistic work. The translator has very fairly maintained the clearness and crispness of the French style, whereby the book is marked with a distinct individuality and self-completeness."—*Nature.*

Demy 8vo, cloth, price 7s. 6d.

MATHEMATICAL PSYCHICS: An Essay on the Application of Mathematics to the Moral Sciences. By F. Y. EDGEWORTH, M.A.

2 vols., large post 8vo, cloth, 32s.

The EVOLUTION of MAN: A Popular Exposition of the Principal Points of Human Ontogeny and Phylogeny. By Prof. ERNST HAECKEL. With Coloured Plates and numerous Engravings on Wood.

"Prof. Haeckel's work is written in an admirably clear style, and the statements of scientific details, illustrated by excellent engravings and diagrams, is such that any attentive reader, however little conversant with such things, can have no difficulty in understanding it."—*Academy.*

2 vols., large post 8vo, cloth, 32s.

The HISTORY of CREATION. By Prof. ERNST HAECKEL. Translation revised by E. RAY LANKESTER, M.A. With Coloured Plates and Genealogical Trees of the various Groups of both Plants and Animals.

"The author has undergone a most difficult task with conscientious skill and marvellous ability."—*Nature.*

Crown 8vo, cloth, 5s.

FREEDOM in SCIENCE and TEACHING. From the German of Prof. ERNST HAECKEL. With a Prefatory Note by T. H. HUXLEY, F.R.S.

Crown 8vo, cloth, 4s. 6d.

CLAIRAUT'S ELEMENTS of GEOMETRY. Translated by Dr. KAINES. With 145 figures.

Crown 8vo, cloth, price 5s.

A CLASS-BOOK of CHEMISTRY, on the Basis of the New System. By EDWARD L. YOUMANS. With 200 Illustrations.

"He has furnished a series of questions which will be found not the least extremely useful by the young student."—*Popular Science Review.*

"We have the greatest possible pleasure in recommending his excellent book, which is certain in its present form to obtain a most honourable position."—*Glasgow News.*

New and Cheaper Edition.

FIRST BOOK of BOTANY. Designed to Cultivate the Observing Powers of Children. By ELIZA A. YOUMANS. With 200 Engravings, crown 8vo, cloth, price 2s. 6d.

"It is not rarely that a school-book appears which is at once so well planned, so well executed in every sense, and so sound in the general views on which it proceeds, as the present volume. . . . It has been everywhere welcomed as a timely and invaluable contribution to the improvement of primary education."—*Pall Mall Gazette.*

New and Cheaper Edition.

FIRST BOOK of ZOOLOGY. With numerous Illustrations. By EDWARD S. MORSE, Ph.D. Crown 8vo, cloth, price 2s. 6d.

"A comprehensive and useful little treatise for pupils who desire to obtain a general knowledge of the structure, habits, modes of growth, and other leading features of the various forms of animal life."—*Standard.*

criticism yet published on the life and contained in Mr. Morley's compendious is vigorous and polished, and both his dgment, and his literary criticisms, are and in a high degree interesting."—

MILTON. By Mark Pattison.

"Every page gives us something new to learn, or something old put in such a way as to be almost equivalent to that which is new."—*Academy*.

HAWTHORNE. By Henry James, Jun.

"Probably no one living could have done so good a book on Hawthorne as Mr. James has done."—*Saturday Review*.

SOUTHEY. By Prof. Dowden.

"A truly scholarly and delightful monograph of a great writer, who has been of late years undeservedly neglected."—*Examiner*.

CHAUCER. By A. W. Ward.

"An enjoyable and excellent little book is this of Professor Ward's. Far away the best connected account of Chaucer and his work to be found in English."—*Academy*.

COWPER. By Goldwin Smith.

"Mr. Goldwin Smith has sketched, in a few decisive touches, the genius of the poet and weakness of the man."—*Daily News*.

BUNYAN. By J. A. Froude.

"The life and character of Bunyan stands out in bold relief, and for the first time the author of the 'Pilgrim's Progress' is portrayed as he really existed."—*Westminster Review*.

BYRON. By Professor Nichol.

"Decidedly one of the most careful and valuable of the whole series. When a book is so good as Prof. Nichol's, there is little to be said about it, except to recommend it as widely as may be."—*Athenæum*.

LOCKE. By Professor Fowler.

"In the case of Locke's biographer we venture to say that Mr. Morley has been exceptionally fortunate. A pen more competent than Professor Fowler's for this particular work might have been sought, and sought in vain."—*Examiner*.

POPE. By Leslie Stephen.

"The sketch of Pope's life which Mr. Leslie Stephen has written is interesting throughout. . . . A work which one can only lay down with the wish to have a good deal more on the same subject by the same hand."—*Academy*.

WORDSWORTH. By F. W. H. Myers.

"Mr. Myers gives us a picture of the man and an estimate of his work which is certainly not inferior to anything that has preceded it. . . . Possibly the best chapter in the book . . . every chapter of which is excellent—is that on Natural Religion."—*Academy*.

DRYDEN. By George Saintsbury.

"Mr. Saintsbury's very careful, fine, and interesting volume . . . seems to us to hold a place of its own amongst the series."—*Daily News*.

Messrs. MACMILLAN & CO.'S PUBLICATIONS

Eversley Edition.

CHARLES KINGSLEY'S NOVELS

MESSRS. MACMILLAN & CO. have the pleasure to announce a **NEW EDITION** of the **NOVELS** of **CHARLES KINGSLEY**, which they will publish immediately under the above title.

This Edition has been planned to meet the wish expressed by many admirers of Mr. KINGSLEY for a beautiful Edition of his Novels. **THE EVERSLEY EDITION** will therefore be printed from new type by Messrs. R. & R. CLARK, on a paper specially manufactured for this work by Messrs. JOHN DICKINSON & Co. The binding will be done by Messrs. JAMES BURN & Co., and the Publishers hope that the mechanical productions will be found in every respect worthy of the books themselves.

THE EVERSLEY EDITION will be comprised in Eleven volumes, Globe 8vo, and will be published at the uniform price of **FIVE SHILLINGS** per volume.

A Portrait by Mr. LOWES DICKINSON of **CHARLES KINGSLEY** in his Study at **Eversley**, newly engraved, will appear as a Frontispiece in the First Volume.

The Books will be published in the following order:—

WESTWARD HO!	**2 vols. 10s.**	*May.*
TWO YEARS AGO	**2 vols. 10s.**	*June.*
HYPATIA	**2 vols. 10s.**	*July.*
YEAST	**1 vol. 5s.**	*August.*
ALTON LOCKE	**2 vols. 10s.**	*September.*
HEREWARD THE WAKE	**2 vols. 10s.**	*October.*

*** *Subscribers' Names will be received by all Booksellers.*

ANTHROPOLOGY: an Introduction to the Study of MAN AND CIVILISATION. By E. B. TYLOR, D.C.L., F.R.S. With numerous Illustrations. Crown 8vo. 7*s.* 6*d.*

"It is an endeavour to put before the lay readers in a clear, condensed, and interesting form the main settled results of investigations into the science of man. . . . Mr. Tylor's admirable little book certainly deserves the success with which it doubtless meet."—*Pall Mall Gazette.*

"It is a most attractive and entertaining introduction to the science of anthropology. . . . His writing is clear and terse and his arrangement masterly."—*Saturday Review.*

MANUAL OF ANCIENT GEOGRAPHY. From the German of Dr. KIEPERT. Crown 8vo. 5*s.*

"Dr. Kiepert actually succeeds in making ancient geography interesting, connecting it as he is able to do from his extensive scholarly knowledge with the natural features of the various countries, the movements of various races, and modern travel. The arrangement is methodical and the treatment clear and well defined, the connection between the Old World and the New being always kept in sight. . . . Altogether the English edition of the Manual will form an indispensable companion to the 'Atlas,' now used in many of our leading schools."—*The Times.*

GRAPHICAL DETERMINATION OF FORCES IN ENGINEERING STRUCTURES. By J. B. CHALMERS, C.E. With Illustrations. 8vo. 24*s.*

THE STEAM ENGINE AND ITS INVENTORS: a Historical Sketch. By ROBERT L. GALLOWAY, Mining Engineer. With numerous Illustrations. Crown 8vo. 10*s.* 6*d.*

"Mr. Galloway's capital little book."—*English Mechanic.*

"A book of singular local and general interest."—*Newcastle Weekly Chronicle.*

"We regard it as a valuable addition to engineering literature."—*Colliery Guardian.*
